Plant Glycosides:

Advances in Plant Glycosides, Chemistry and Biology Chong-Ren Yang, Osamu Tanaka, 1999-02-03 In the plant kingdom a variety of chemical constituents occur in a glycoside form conjugation with sugar Glycosides are important secondary metabolites The structural diversity is a result of the vast amount of varieties and stereochemical configurations of the sugar component Aglycones belong to terpenoid steroid flavonoid quinonoid lignan other simple phenolics and isothiocyanate However biological activities of glycosides are in many cases susceptible to the nature of sugar moieties even though their aglycone is the same Since the 80s plant glycosides have been attracting an increasing volume of interest from botanists and phytochemists world wide for the following reasons They are difficult to isolate and purify They have a very important biological function in plant life and remarkable biological activities They are a very important resource of natural medicine health food cosmetics and food supplements The first International Symposium on Plant Glycosides ISPG held in Kunming China was attended by more than 150 scientists from 17 countries During the four day meeting 96 reports on plant glycosides including structure elucidation ethnobotany pharmacology quantitative evaluation synthesis pharmacology and biotechnology were presented 54 of these papers are given in this volume All these papers review recent research results on plant glycosides The Plant Glycosides Robert Joseph McIlroy, 1951

John W. Rowe, 1989-12-28 Wood as found in trees and bushes was of primary importance to ancient humans in their struggle to control their environment Subsequent evolution through the Bronze and Iron Ages up to our present technologically advanced society has hardly diminished the importance of wood Today its role as a source of paper products furniture building materials and fuel is still of major significance Wood consists of a mixture of polymers often referred to as lignocellulose The cellulose microfibrils consist of an immensely strong linear polymer of glucose They are associated with smaller more complex polymers composed of various sugars called hemicelluloses These polysaccharides are embedded in an amorphous phenylpropane polymer lignin creating a remarkably strong composite structure the lignocellulosic cell wall Wood also contains materials that are largely extraneous to this lignocellulosic cell wall These extracellular substances can range from less than 1070 to about 35% of the dry weight of the wood but the usual range is 2% 10% Among these components are the mineral constituents salts of calcium potassium sodium and other metals particularly those present in the soil where the tree is growing Some of the extraneous components of wood are too insoluble to be extracted by inert solvents and remain to give extractive free wood its color very often these are high molecular weight polyphenolics
