**Fracturing** Ronald W. Armstrong,2020-11-03 The modern understanding of metal plasticity and fracturing began about 100

years ago with pioneering work first on crack induced fracturing by Griffith and second with the invention of dislocation enhanced crystal plasticity by Taylor Orowan and Polanyi The modern counterparts are fracture mechanics as invented by Irwin and dislocation mechanics as initiated in pioneering work by Cottrell No less important was the breakthrough development of optical characterization of sectioned polycrystalline metal microstructures started by Sorby in the late 19th century and leading eventually to modern optical x ray and electron microscopy methods for assessments of crystal fracture surfaces via fractography and particularly of x ray and electron microscopy techniques applied to quantitative characterizations of internal dislocation behaviors A major current effort is to match computational simulations of metal deformation fracturing behaviors with experimental measurements made over extended ranges of microstructures and over varying external conditions of stress state temperature and loading rate The relation of such simulations to the development of constitutive equations for a hoped for predictive description of material deformation fracturing behaviors is an active topic of research The present collection of articles provides a broad sampling of research accomplishments on the two subjects
