Polarized Spectroscopy Of Ordered Systems:

Polarized Spectroscopy of Ordered Systems B. Samori',E.W. Thulstrup,2012-12-06 Ordered systems exhibit physical properties and behavior unknown in media where structural ordering and organization do not take place In ordered systems special correlations between molecules exist and the results are remarkable properties the functional order of biological systems the electrooptical and mechanical proper ties of liquid crystalline materials and stretched polymers are just a few examples New methods and techniques in optical spectroscopy have recently been developed to study ordered systems and guest molecules This stimulated the organization of a NATO Advanced Study Institute bringing together chemists and physicists from optical spectroscopy materials science and biology Thereby a unifying and interdisciplinary survey of possible applications of spectroscopy with polarized light to ordered systems such as liquid crystals stretched polymers polymeric liquid crystals and membranes was achieved The interdisciplinary approach of the meeting is reflected in the book Different aspects of the same topic are often treated in several chapters all through the book Therefore each reader should look for the contributions which serves his needs even if this means that some chapters will be skipped The Advanced Study Institute New Developments in Polarized Spectroscopy of Ordered Systems was the first scientific event of the celebrations of the 900th anniversary of the University of Bologna

The Molecular Dynamics of Liquid Crystals G.R. Luckhurst,C.A. Veracini,2012-12-06 Liquid crystalline phases are now known to be formed by an ever growing range of quite diverse materials these include those of low molecular weight as well as the

novel liquid crystalline polymers such phases can also be induced by the addition of a solvent to amphiphilic systems leading to lyotropic liquid crystals Irrespective of the structure of the constituent molecules these numerous liquid crystal phases are characterised by their long range orientational order In addition certain phases exhibit elements of long range positional order Our understanding both experimental and theoretical at the molecular level of the static behaviour of these fascinating and important materials is now well advanced In contrast the influence of the long range order both orientational and positional on the molecular dynamics in liquid crystals is less well understood In an attempt to address this situation a NATO Advanced Study Institute devoted to liquid crystal dynamics was held at n Ciocco Barga Italy in September 1989 This brought together experimentalists and theoreticians concerned with the various dynamical processes occurring in all liquid crystals The skills of the participants was impressively wide ranging they spanned the experimental techniques used in the study of molecular dynamics the nature of the systems investigated and the theoretical models employed to understand the results While much was learnt it was also recognised that much more needed to be done in order to advance our understanding of molecular dynamics in liquid crystals
