The Mind-Body Problem Mario Bunge, 2014-05-09 The Mind Body Problem A Psychobiological Approach examines the mind body problem from a psychobiological perspective It intends to show that the idea of a separate mental entity is not only unwarranted by the available data and the existing psychological models but collides head on with the most fundamental ideas of all modern science and is thus a stumbling block to progress The book abandons ordinary language in favor of the state space language which is mathematically precise and is shared by science and scientific philosophy Comprised of 10 chapters this monograph begins with an overview of the mind body problem and its main proposed solutions classified into main genera psychophysical monism and psychophysical dualism In particular ten views on the mind body problem are analyzed along with three main varieties of materialism with regards to the problem eliminative reductive or leveling and emergentist The discussion then turns to the notion of a concrete or material system based on the assumption that behavior is an external manifestation of neural processes Subsequent chapters explore the specific functions of the central nervous system sensation and perception behavior and motivation memory and learning thinking and knowing and consciousness and personality The book also considers sociality and social behavior in animals before concluding with an assessment of a psychological explanation of the mind with emphasis on dualism and monism This work will be of interest to students academicians practitioners and investigators in the fields of psychobiology psychology neurophysiology and philosophy

A Critical History

of Psychology Thomas Hardy Leahey, 2025-05-27 This fully updated and refreshed 9th edition places social economic and political forces of change alongside psychology's internal theoretical and empirical arguments. It utilizes a critical lens to illuminate the way in which the external world has shaped the development of psychology and in turn how psychology from antiquity to modernity has shaped society. The text approaches the material from an integrative rather than wholly linear perspective, carefully examining how issues in psychology reflect and affect concepts that lie outside the field of psychology's technical concerns as a science and profession. Key features of this edition include: A newly reconsidered structure including five additional interludes exploring historical background narratives and the rise of modernity to allow for flexible and adaptable textbook use; Expanded exploration of the two psychologies: the Way of Ideas driven by epistemology and unique to Europe and The Way of Human Nature a universal concern to find a science of human behavior and its management. Including scientific applied and professional psychology as well as coverage of the social sciences and social policy implications, this book is appropriate for high level undergraduate and graduate students. *A System of Psychology* Daniel Greenleaf Thompson, 1884 *The Human Intellect: with an Introduction Upon Psychology and the Soul* Noah Porter, 1873

The Human Intellect, with an Introduction Upon Psychology and the Soul Noah Porter (the Younger.), 1872

Studies in the Evolutionary Psychology of Feeling Hiram M. Stanley, 2019-10-10 It is now something more than a century since the general division of psychic phenomena into intellect feeling and will first came into repute but still some psychologists of note do not agree to this fundamental classification but would unite feeling and will in a single order. As to the subdivisions of feeling and will we are confessedly wholly at sea. In intellect it is only on the lower side sensation and perception that anything of great scientific value has been accomplished and even now it cannot be said that the classes of sensation have been marked off with perfect certainty. In the higher range of intellect psychology can do scarcely more than accept some ready made divisions from common observation and logic. And if so little has been settled in the comparatively simple work of a descriptive classification of the facts of mind we may be assured that still less has been accomplished toward a scientific consensus for the laws of mind. Weber's law alone seems to stand on any secure basis of experiment but its range and meaning are still far from being determined. Even the laws of the association of ideas are still the subjects of endless controversy. Also in method there is manifestly the greatest disagreement. The physiological and introspective schools each magnify their own methods sometimes so far as to discredit all others. Physiological method has won for itself a certain standing indeed but just what are its limitations is still far from being settled. Syllabus of a Course in Pedagogy
