## Target Vs:

Target-related Coupling in Bimanual Coordination Matthias Weigelt, 2005-07-04 It is concluded that the control of bimanual actions can be explained by target coordination. Experimental evidence has been provided to support the notion that the bimanual coupling effects observed during the simultaneous coordination of the two hands relate to movement targets but not to the movements themselves. These bimanual coupling effects are transient as the initial preparation advantage for bimanual movements to the same targets vanishes with longer time to prepare the actions. The transient target coupling hypothesis states that bimanual movements directed at different targets can be prepared equally well as bimanual movements directed at the same targets when there is sufficient time for movement preparation to take place. It is further suggested that participants established a mental representation of the action environment task set where the actions targets were represented in terms of their spatial correspondence relative to the active effectors. Relative spatial position hypothesis. The present findings are in line with theories emphasizing the roles of movement extrinsic targets and intended action goals on action control. Thus the coordination of the two hands must be seen in service of these external targets and action goals.

*Inertial Fusion Energy Target Injection, Tracking, and Beam Pointing* Ronald Wayne Petzoldt, 1995 Scientific and Technical Aerospace Reports, 1981-04 Nanocomposite Coatings and Nanocomposite Materials Andreas Öchsner, W. Ahmed, N. Ali, 2009-02-11 Volume is indexed by Thomson Reuters BCI WoS. Nanocomposite materials are formed by mixing two or more dissimilar materials at the nanoscale in order to control and develop new and improved structures and properties. The properties of nanocomposites depend not only upon the individual components used but also upon the morphology and the interfacial characteristics. Nanocomposite coatings and materials are among the most exciting and fastest growing areas of research with new materials being continually developed which often exhibit novel properties that are absent in the constituent materials. Nanocomposite materials and coatings therefore offer enormous potential for new applications including aerospace, automotive, electronics, biomedical implants, non-linear optics, mechanically reinforced lightweight materials, sensors, nano-wires, batteries, bioceramics, energy conversion and many others.
