Random Projection Method:

The Random Projection Method Santosh S. Vempala, *The Random Projection Method* Santosh Srinivas Vempala, 2004 Random projection is a simple geometric technique for reducing the dimensionality of a set of points in Euclidean space while preserving pairwise distances approximately The technique plays a key role in several breakthrough developments in the field of algorithms In other cases it provides elegant alternative proofs The book begins with an elementary description of the technique and its basic properties Then it develops the method in the context of applications which are divided into three groups The first group consists of combinatorial optimization problems such as maxcut graph coloring minimum multicut graph bandwidth and VLSI layout Presented in this context is the theory of Euclidean embeddings of graphs The next group is machine learning problems specifically learning intersections of halfspaces and learning large margin hypotheses The projection method is further refined for the latter application The last set consists of problems inspired by information retrieval namely nearest neighbor search geometric clustering and efficient low rank approximation Motivated by the first two applications an extension of random projection to the hypercube is developed here Throughout the book random projection is used as a way to understand simplify and connect progress on these important and seemin The book is suitable for graduate students and research mathematicians interested in computational geometry

Entropy Randomization in Machine Learning Yuri S. Popkov, Alexey Yu. Popkov, Yuri A. Dubnov, 2022-08-09 Entropy Randomization in Machine Learning presents a new approach to machine learning entropy randomization to obtain optimal solutions under uncertainty uncertain data and models of the objects under study Randomized machine learning procedures involve models with random parameters and maximum entropy estimates of the probability density functions of the model parameters under balance conditions with measured data Optimality conditions are derived in the form of nonlinear equations with integral components A new numerical random search method is developed for solving these equations in a probabilistic sense Along with the theoretical foundations of randomized machine learning Entropy Randomization in Machine Learning considers several applications to binary classification modelling the dynamics of the Earth's population predicting seasonal electric load fluctuations of power supply systems and forecasting the thermokarst lakes area in Western Siberia Features A systematic presentation of the randomized machine learning problem from data processing through structuring randomized models and algorithmic procedure to the solution of applications relevant problems in different fields Provides new numerical methods for random global optimization and computation of multidimensional integrals A universal

Book News Inc *Experimental Study of Random Projections Below the JL Limit* Xiuyi Ye (Software engineer), 2015 Random projection is a method used to reduce dimensionality of desired objects with pair wise distances preserved at a relatively high probability The mathematical theory behind this is called the Johnson Lindenstrauss JL lemma So the basic idea of the JL lemma is that a set of points in a high dimensional space p are randomly projected down to a lower dimensional space q This q can be as low as q_0 to still make sure that with a certain probability the projected pair wise distances are within plus minus ϵ of the pairwise distances before the projection where plus or minus ϵ is usually a very small value This

technique has already been used in a variety of areas like clustering image and text data processing Lots of researchers have already studied the properties and performance of the JL lemma above q_0 q is usually called the JL limit or JL bound where $q \geq 1$ $p \geq 2$ $q_0 \geq 1$ but no research has investigated using the JL lemma below the JL limit $q < q_0$ $1 \leq q_0 \leq 2$ With much lower dimension the data processing storing almost everything is going to be so much easier We can visualize the clustering information about data sets in 2D plots One thing should not be forgotten is that the distance preservation is probabilistic How well will the distances being preserved below the JL bound Will it affect or even completely destroy the cluster structure after the projection What is a good projection method We are going to study and answer these questions as much as we can in this thesis
