Rate Distortion Based Video Compression:

Rate-Distortion Based Video Compression Guido M. Schuster, Aggelos Katsaggelos, 2013-03-09 One of the most intriguing problems in video processing is the removal of the redundancy or the compression of a video signal. There are a large number of applications which depend on video compression. Data compression represents the enabling technology behind the multimedia and digital television revolution. In motion compensated lossy video compression the original video sequence is first split into three new sources of information: segmentation, motion, and residual error. These three information sources are then quantized, leading to a reduced rate for their representation but also to a distorted reconstructed video sequence. After the decomposition of the original source into segmentation, motion, and residual error information is decided, the key remaining problem is the allocation of the available bits into these three sources of information. In this monograph a theory is developed which provides a solution to this fundamental bit allocation problem. It can be applied to all quad tree based motion compensated video coders which use a first order differential pulse code modulation (DPCM) scheme for the encoding of the displacement vector field (DVF) and a block based transform scheme for the encoding of the displaced frame difference (DFD). An optimal motion estimator which results in the smallest DFD energy for a given bit rate for the encoding of the DVF is also a result of this theory. Such a motion estimator is used to formulate a motion compensated interpolation scheme which incorporates a global smoothness constraint for the DVF. *Intelligent Multimedia Processing with Soft Computing* Yap Peng Tan, Kim-Hui Yap, Lipo Wang, 2006-09-15 Soft computing represents a collection of techniques such as neural networks, evolutionary computation, fuzzy logic, and probabilistic reasoning. As posed to conventional hard computing, these techniques tolerate imprecision and uncertainty similar to human beings. In the recent years, successful applications of these powerful methods have been published in many disciplines in numerous journals, conferences, as well as the excellent books in this book series on Studies in Fuzziness and Soft Computing. This volume is dedicated to recent novel applications of soft computing in multimedia processing. The book is composed of 21 chapters written by experts in their respective fields addressing various important and timely problems in multimedia computing such as content analysis, indexing, and retrieval, recognition, and compression, processing, and filtering, etc. In the chapter authored by Guan Muneesawang Lay Amin and Lee, a radial basis function network with Laplacian mixture model is employed to perform image and video retrieval. D. Androutsos, P. Androutsos, Plataniotis, and Venetsanopoulos investigate color image indexing and retrieval within a small world framework. Wu and Yap develop a framework of fuzzy relevance feedback to model the uncertainty of users' subjective perception in image retrieval. Algorithms, Complexity Analysis and VLSI Architectures for MPEG-4 Motion Estimation Peter M. Kuhn, 2013-06-29 MPEG 4 is the multimedia standard for combining interactivity, natural and synthetic digital video, audio, and computer graphics. Typical applications are internet video conferencing, mobile videophones, multimedia cooperative work, teleteaching, and games. With MPEG 4 the next step from block based video.
