Seminar on Stochastic Analysis, Random Fields and Applications Erwin Bolthausen,Marco Dozzi,Francesco Russo,2012-12-06 Pure and applied stochastic analysis and random fields form the subject of this book The collection of articles on these topics represent the state of the art of the research in the field with particular attention being devoted to stochastic models in finance Some are review articles others are original papers taken together they will apprise the reader of much of the current activity in the area

Locally Perturbed Random Walks Alexander Iksanov,Alexander Marynych,Andrey Pilipenko,Ihor Samoilenko,2025-05-23 This monograph provides a comprehensive overview of locally perturbed random walks tools used for their analysis and current research on their applications The authors present the material in a self contained manner providing strong motivation in Chapter One with illustrative examples of locally perturbed random walks and an introduction of the mathematical tools that are used throughout the book Chapter Two shows the construction of various stochastic processes that serve as scaling limits for locally perturbed random walks particularly focusing on reflected and skewed processes In Chapter Three the authors prove various limit theorems for these perturbed random walks The final chapter serves as an appendix that collects essential background material for readers who wish to understand the arguments more deeply Locally Perturbed Random Walks will appeal to researchers interested in this area within modern probability theory It is also accessible to students who have taken a second course in probability

An Introduction to Branching Measure-Valued Processes Evgeniï Borisovich Dynkin,1994 For about half a century two classes of stochastic processes Gaussian processes and processes with independent increments have played an important role in the development of stochastic analysis and its applications During the last decade a third class branching measure valued BMV processes has also been the subject of much research A common feature of all three classes is that their finite dimensional distributions are infinitely divisible allowing the use of the powerful analytic tool of Laplace or Fourier transforms All three classes in an infinite dimensional setting provide means for study of physical systems with infinitely many degrees of freedom This is the first monograph devoted to the theory of BMV processes Dynkin first constructs a large class of BMV processes called superprocesses by passing to the limit from branching particle systems Then he proves that under certain restrictions a general BMV process is a superprocess A special chapter is devoted to the connections between superprocesses and a class of nonlinear partial differential equations recently discovered by Dynkin

Random Walks, Brownian Motion, and Interacting Particle Systems H. Kesten,R. Durrett,1991-06-01 This collection of articles is dedicated to Frank Spitzer on the occasion of his 65th birthday The articles written by a group of his friends colleagues former students and coauthors are intended to demonstrate the major influence Frank has had on probability theory for the last 30 years and most likely will have for many years to come Frank has always liked new phenomena clean formulations and elegant proofs He has created or opened up several research areas and it is not surprising that many people are still

working out the consequences of his inventions By way of introduction we have reprinted some of Frank's seminal articles so that the reader can easily see for himself the point of origin for much of the research presented here These articles of Frank's deal with properties of Brownian motion fluctuation theory and potential theory for random walks and of course interacting particle systems The last area was started by Frank as part of the general resurgence of treating problems of statistical mechanics with rigorous probabilistic tools

Stochastic Analysis and Related Topics VII Laurent Decreusefond, Bernt Oksendal, Ali S. Üstünel, 2001-01-25 One of the most challenging subjects of stochastic analysis in relation to physics is the analysis of heat kernels on infinite dimensional manifolds The simplest nontrivial case is that of the path and loop space on a Lie group In this volume an up to date survey of the topic is given by Leonard Gross a prominent developer of the theory Another concise but complete survey of Hausdorff measures on Wiener space and its applications to Malliavin Calculus is given by D Feyel one of the most active specialists in this area Other survey articles deal with short time asymptotics of diffusion processes with values in infinite dimensional manifolds and large deviations of diffusions with discontinuous drifts A thorough survey is given of stochastic integration with respect to the fractional Brownian motion as well as Stokes formula for the Brownian sheet and a new version of the log Sobolev inequality on the Wiener space Professional mathematicians looking for an overview of the state of the art in the above subjects will find this book helpful In addition graduate students as well as researchers whose domain requires stochastic analysis will find the original results of interest for their own research The organizers acknowledge gratefully the financial help of the University of Oslo and the invaluable aid of Professor Bernt Oksendal and l Ecole Nationale Supérieure des Telecommunications

INFINITELY DIVISIBLE RANDOM MEASURES AND SUPERPROCESSES DONALD A DAWSON 1 Introduction

Random Toeplitz Functionals and Their Applications Mamikon S. Ginovyan, 2025-11-14 This book presents recent findings on central and non central limit theorems for Toeplitz and tapered Toeplitz random quadratic functionals of stationary processes with applications in spectral based statistical inference It focuses on Gaussian orthogonal increment driven and Levy driven linear stationary processes with memory in both discrete

and continuous time Toeplitz matrices and operators are central to the study of stationary processes The covariance matrix of a discrete time stationary process is a truncated Toeplitz matrix generated by the process's spectral density in continuous time this becomes a Toeplitz operator The foundations of the trace approximation problem were laid by Grenander and Szeg in their classical monograph *Toeplitz Forms and Their Applications* 1958 and the subject has recently seen renewed interest due to developments in long range dependence and tapered data analysis The book addresses topics that are often overlooked in other texts including the trace approximation problem central limit theorems in continuous time functional central and non central limit theorems for Toeplitz processes and central limit theorems for tapered functionals It also covers approaches to estimating linear and nonlinear spectral functionals Whittle estimators and goodness of fit tests using tapered data each enriched by new advances in the field Comprising ten chapters and two appendices the book begins with an overview of the main problems and a review of foundational concepts from real analysis functional analysis and matrix analysis It then introduces a model that is a second order stationary process and discusses key concepts and results from the general theory of stationary processes before delving into the trace approximation problem Subsequent chapters cover central and non central limit theorems for Toeplitz and tapered Toeplitz random quadratic functionals and explore statistical inference problems The appendices discuss the motivations and benefits of data tapering and outline several important problems closely related to the main themes of the book The text will be a valuable resource for researchers in time series analysis econometrics finance and applied statistics It is suitable for graduate level courses in time series analysis or the statistics of stochastic processes and as a supplementary reference for students of advanced statistics probability econometrics or finance
