Simulating Continuous Fuzzy Systems:

Simulating Continuous Fuzzy Systems James J. Buckley, Leonard J. Jowers, 2006 This book is the companion text to *Simulating Fuzzy Systems* which investigated discrete fuzzy systems through crisp discrete simulation. The current book studies continuous fuzzy dynamical systems using crisp continuous simulation. We start with a crisp continuous dynamical system whose evolution depends on a system of ordinary differential equations (ODEs). The system of ODEs contains parameters many of which have uncertain values. Usually point estimators for these uncertain parameters are used but the resulting system will not display any uncertainty associated with these estimators. Instead we employ fuzzy number estimators constructed from expert opinion or from data for the uncertain parameters. Fuzzy number estimators produce a system of fuzzy ODEs to solve whose solution will be fuzzy trajectories for the variables. We use crisp continuous simulation to estimate the trajectories of the support and core of these fuzzy numbers in a variety of twenty applications of fuzzy dynamical systems. The applications range from Bungee jumping to the AIDS epidemic to dynamical models in economics.

Simulating Continuous Fuzzy Systems James J. Buckley, Leonard J. Jowers, 2008-01-25 1 1 Introduction This book is written in two major parts. The first part includes the introductory chapters consisting of Chapters 1 through 6. In part two, Chapters 7-26 we present the applications. This book continues our research into simulating fuzzy systems. We started with investigating simulating discrete event fuzzy systems [7, 13, 14]. These systems can usually be described as queuing networks. Items/transactions arrive at various points in the system and go into a queue waiting for service. The service stations preceded by a queue are connected forming a network of queues and service until the transaction finally exits the system. Examples considered included Chinese shops, emergency rooms, project networks, bus routes, etc. Analysis of all of these systems depends on parameters like arrival rates and service rates. These parameters are usually estimated from historical data. These estimators are generally point estimators. The point estimators are put into the model to compute system descriptors like mean time an item spends in the system or the expected number of transactions leaving the system per unit time. We argued that these point estimators contain uncertainty not shown in the calculations. Our estimators of these parameters become fuzzy numbers constructed by placing a set of confidence intervals one on top of another. Using fuzzy number parameters in the model makes it into a fuzzy system. The system descriptors we want, time in system, number leaving per unit time, will be fuzzy numbers.

Cyber-Physical Systems: Intelligent Models and Algorithms Alla G. Kravets, Alexander A. Bolshakov, Maxim Shcherbakov, 2022-03-29 This book is devoted to intelligent models and algorithms as the core components of cyber physical systems. The complexity of cyber physical systems developing and deploying requires new approaches to its modelling and design. Presents results in the field of modelling technologies that leverage the exploitation of artificial intelligence including artificial general intelligence (AGI) and weak artificial intelligence. Provides scientific practical and methodological approaches based on bio inspired methods, fuzzy models and algorithms, predictive modelling, computer vision and image processing. The

Jowers,2007 Simulations of modeled systems are effective tools for evaluating system attributes fuzzy logic provides for simulation of systems with inherent uncertainties This re search to advance simulation of fuzzy systems involves several studies in a planned sequence Continuous fuzzy system modeling activities constitute a first stage of research action a natural flow from earlier work on modeling discrete fuzzy systems the notion of using crisp simulation to carry out fuzzy computations is at the heart of the work This activity requires choosing tools and problems with which to demonstrate feasibility and broad applicability of the approach Some fundamental issues underlying the work provoke new departures for the second stage consisting of two substages The first substage involves a new fuzzy number FN concept that of a B zier generated FN BGFN These numbers were conceived at a very basic level to illustrate that the approach we take is not rooted in or confined to simple tri angular FNs TFN that are often used in modeling Their potential lies in both previous discrete simulation and in continuous simulation The second substage of continuous modeling pursues these numbers in relation to
