Autologous and Cancer Stem Cell Gene Therapy Roger Bertolotti, Keiyo Ozawa, 2008 Stem cells provide for life long cell replacement in tissues and organs and have inherent homing abilities that are critical in therapeutic applications Stem cells are also the driving force of cancer where genetic epigenetic alterations culminate in tumorigenesis either in tissue stem cells or in some of their derivatives As a rare subset of the tumor cancer stem cells are the only drive of tumor initiation propagation Autologous and cancer stem cells are thus the key targets of 1 long term and transient regenerative epigenetic gene therapy and 2 of recurrence free anticancer therapy respectively While cancer stem cell gene therapy still needs time to accomplish autologous stem cells have been instrumental in the first unequivocal successes for gene therapy whereby ex vivo retrovirally corrected hematopoietic stem cells have been returned to the patients This timely book presents 1 the aforementioned stem cell gene therapy achievements that rely on random integration of therapeutic transgenes into host chromosomes and 2 emerging experimental approaches aimed at eliminating random integration oncogenic hazards through site specific integration or gene targeting Breakthrough endonuclease boosted gene targeting for gene correction inherited diseases or targeted integration of therapeutic transgenes other disorders culminating in an efficiency compatible with clinical trials is one of the highlights of the book Highlights also include the pioneering transplantation of adult pluripotent stem cells as a substitute for tissue specific stem cells thereby pinpointing the invaluable potential for stem cell gene therapy

applications of autologous cells able to contribute to all three germ layers Stem cell gene therapy is thus discussed in terms of 1 magnifying stem cell therapeutic homing through transient regenerative gene therapy and 2 of tackling most pathologies including mitochondrial DNA diseases and ageing disorders through stem cell repopulation dynamics into appropriate niches long term engraftment and tissues cell turn over Regarding cancer stem cell gene therapy focus is on both the increasing number of identified tissue specific cancer stem cells as the ultimate therapeutic targets and on the development of armed stem cells as tumor homing vectors for targeted anticancer therapy Sample Chapter s Introduction Toward a Universal Platform for Autologous Stem Cell Gene Therapy 335 KB Chapter 1 Stem Cell Gene Therapy for ADA Deficiency without Myelopreparative Conditioning 318 KB Contents Introduction Toward a Universal Platform for Autologous Stem Cell Gene Therapy Long term Stem Cell Gene Therapy From Current Clinical Random Integration Achievements to Stem Cell Gene Targeting Cybridization From Pioneering Clinical Retroviral Gene Therapy to Experimental Site Specific Integrative Gene Therapy Stem Cell Gene Targeting Cybridization Toward Endonuclease Boosted Gene Repair Alteration Custom Site Specific Integrative Gene Therapy and Transmitochondrial Therapy Rejuvenation Adult Pluripotent Stem Cells Emerging Stem Cell Gene Therapy Breakthrough Cancer Stem Cell Gene Therapy Cancer Stem Cells as Breakthrough Targets of Cancer Gene Therapy Armed Stem Cells as Tumor Homing Vectors for Cancer Gene Therapy Readership Clinicians scientists physicians veterinarians dentists pharmacists chemists interested in an ongoing medical veterinarian breakthrough that is expected to revolutionize the practice of Medicine Dentistry and that relies on cell biology molecular biology genetics developmental biology biochemistry molecular pathology and animal science **Advances in Neuroregulation and Neuroprotection**

Arnes,2006 Embryonic stem cells have the ability to develop into virtually any cell in the body and may have the potential to treat medical conditions such as diabetes and Parkinson s disease In August 2001 President Bush announced that for the first time federal funds would be used to support research on human embryonic stem cells but funding would be limited to existing stem cell lines The National Institutes of Health NIH has established the Human Embryonic Stem Cell Registry which lists stem cell lines that are eligible for use in federally funded research Although 78 cell lines are listed 21 embryonic stem cell lines are currently available Scientists are concerned about the quality longevity and availability of the eligible stem cell lines For a variety of reasons many believe research advancement requires new embryonic stem cell lines and for certain applications stem cells derived from cloned embryos may offer the best hope for progress in understanding and treating disease A significant cohort of pro life advocates support stem cell research those

opposed are concerned that the isolation of stem cells requires the destruction of embryos Letters from Congress one signed by 206 Members of the House and a second signed by 58 Senators have been sent urging President Bush to expand the current federal policy concerning embryonic stem cell research Some have argued that stem cell research be limited to adult stem cells obtained from tissues such as bone marrow They argue that adult stem cells should be pursued instead of embryonic stem cells because they believe the derivation of stem cells from either embryos or aborted fetuses is ethically unacceptable Other scientists believe adult stem cells should not be the sole target of research because of important scientific and technical limitations Groups make ethical distinctions in the debate on how to proceed with stem cell research based upon embryo protection relief of suffering viability the purpose and timing of embryo creation and destruction donor consent scientific alternatives federal funding and cloning Other countries are moving fast with active research programs This book presents the current confused situation along with a selective bibliography
