Pipeflow Analysis Developments In Water Science Volume 19:

Microcomputer Programs for Groundwater Studies D. Clarke, 1987-06-01 This book provides the practising hydrogeologist with a selection of microcomputer programs which the author has found to be very useful as an aid in the investigation of groundwater wells and aquifers The programs are written in BASIC and are designed to suit as wide a range of computer as possible The book begins with a group of programs which solve several of the most common functions encountered in groundwater science These are then developed into programs capable of calculating drawdown in a variety of discharge rate aquifer boundary configurations either at one time or a series of exponentially increasing times The author shows how a computerised form of Newtons method for solving difficult equations may be applied to such tasks as evaluating storage coefficient if transmissivity is known Lagrangian interpolation is used to produce accurate values from tabled functions either within a program or on demand One of the major programs in the book may be used to enter discharge test data into a computer edit it as required e g change drawdown measurements from feet to metres or water levels to drawdowns etc and finally to analyse the data For example three different methods are provided for evaluation of the well equation Another program is provided for controlling a plotter to produce several popular types of discharge test graphs and a new image well method is included for simulating boundaries consisting of straight line junctions between areas of two different transmissivities This is a practical book written to solve real life problems Accordingly program operation is clearly described but derivation of equations and functions have been omitted For those readers wishing to check on derivations references are provided Readers familiar with microcomputer programming may apply the programs given here to their own work perhaps incorporating them as subroutines into large more specialized programs Those unfamiliar with programming can use the programs as they are listed All programs are designed to be run with no more than an occasional reference to the written instructions being necessary

Hydrology of the Nile Basin M.M.A. Shatin, 1985-01-01 A wealth of hydrological hydrometeorological hydrometrical and other related data covering nearly all parts of the Nile Basin is presented in this volume After an introductory chapter on the Nile s history chapters cover the physiography topography and climate of the different parts of the Nile Basin rainfall on the Basin evaporation from open surfaces and evapotranspiration from cropped areas Rainfall data for a 30 year period from 1938 to 1967 are summarized and analyzed evaporation and evapotranspiration measurements are presented analyzed and discussed In the absence of actual measurements attempts have been made to estimate them from a number of formulae using the available climatological normals The results obtained are important for planning design and management of water supply and control projects especially for irrigation and drainage The geology of the Nile Basin is briefly reviewed and its effect on groundwater potentials quality and quantity is discussed Surface runoff and discharge at the key stations is covered and an extensive review given of existing water storage control and conservation projects in the Nile Basin Thus the volume contains an enormous amount of data that will be of great practical value to
