The aim of the series is to present new and important developments in pure and applied mathematics. Well established in the community over two decades it offers a large library of mathematics including several important classics. The volumes supply thorough and detailed expositions of the methods and ideas essential to the topics in question. In addition they convey their relationships to other parts of mathematics. The series is addressed to advanced readers wishing to thoroughly study the topic.

Dirichlet Forms and Analysis on Wiener Space Nicolas Bouleau, Francis Hirsch, 2010-10-13

The subject of this book is analysis on Wiener space by means of Dirichlet forms and Malliavin calculus. There are already several literatures on this topic but this book has some different viewpoints. First the authors review the theory of Dirichlet forms but they observe only functional analytic potential theoretical and algebraic properties. They do not mention the relation with Markov processes or stochastic calculus as discussed in usual books e.g. Fukushima's book. Even on analytic properties instead of mentioning the Beurling-Deny formula they discuss Carr du Champ operators introduced by Meyer and Bakry very carefully. Although they discuss when this Carr du Champ operator exists in general situation the conditions they gave are rather hard to verify and so they verify them in the case of Ornstein-Uhlenbeck operator in Wiener space later. It should be noticed that one can easily show the existence of Carr du Champ operator in this case by using Shigekawa's H-derivative. In the part on Malliavin calculus the authors mainly discuss the absolute continuity of the probability law of Wiener functionals. The Dirichlet form corresponds to the first derivative only and so it is not easy to consider higher order derivatives in this framework. This is the reason why they discuss only the first step of Malliavin

calculus On the other hand they succeeded to deal with some delicate problems the absolute continuity of the probability law of the solution to stochastic differential equations with Lipschitz continuous coefficients the domain of stochastic integrals Itô-Ramér Skorokhod integrals etc This book focuses on the abstract structure of Dirichlet forms and Malliavin calculus rather than their applications However the authors give a lot of exercises and references and they may help the reader to study other topics which are not discussed in this book Zentralblatt Math Reviewer S Kusuoka Hongo Arithmetik Abelscher Varietäten mit komplexer Multiplikation C.-G.
