Abstract: Horticultural crops are a crucial component of agriculture worldwide and have great economic value. The notorious plant fungal pathogen *Botrytis cinerea* can cause gray mold disease in over 200 horticultural crops, leading to severe economic losses. Investigating the mechanisms underlying plant defense responses to pathogens is crucial for developing new strategies for effectively controlling plant diseases, and much progress has occurred in the mechanisms underlying defense responses of horticultural crops to *B. cinerea* mainly due to the completion of genome sequencing and the establishment of efficient tools for functional genomics. In this review, recent progress in mechanisms underlying defense responses and natural products that can enhance the resistance of horticultural crops to *B. cinerea* are summarized, and future research directions are also discussed.

Keywords: *Botrytis cinerea*; plant defense responses; pattern-triggered immunity; hormone; disease control

1. Introduction

Horticultural crops include fruits, vegetables, and ornamental plants, containing enormous nutritional and ornamental value. Production and consumption of horticultural products are developing rapidly, thereby attracting much attention [1]. However, horticultural crops are seriously threatened by various pathogens in the field, transport, storage, and even market [2]. *B. cinerea*, the second most important fungal plant pathogen, can cause gray mold disease in over 200 horticultural crops, such as tomato, strawberry, grape, and rose, resulting in severe economic losses [3,4]. Health or environmental risks derived from synthetic fungicides and fungicide resistance are increasingly concerning [5,6]. Thus, it is imperative to develop new strategies for effectively controlling gray mold disease.

During pathogen–plant interactions, plants have evolved unique disease resistance mechanisms and strategies to deal with pathogens to reduce the damage [7]. With the development of genome sequencing [8], and the establishment of efficient tools for functional genomics [9], there have been numerous important advances in our understanding of the molecular biology of members in plant defense response to pathogens. Pattern-triggered immunity (PTI) is a key component of plant immune responses to *B. cinerea* [10], and components in plant PTI signaling, transcription factors, and proteins in hormone synthesis and signaling were proven to be important regulators against *B. cinerea* infection [11]. This article reviews the research progress on defense response mechanisms of horticultural crops and natural products that enhance resistance to *B. cinerea* in recent years, and prospects for future research directions.
