Molecular Mechanisms and Physiological Significance of Organelle Interactions and Cooperation Michael Schrader, Markus Islinger, 2017-02-28 Eukaryotic cells contain distinct membrane bound organelles which compartmentalise cellular proteins to fulfil a variety of vital functions Many organelles have long been regarded as isolated and static entities e g peroxisomes mitochondria lipid droplets but it is now evident that they display dynamic changes interact with each other share certain proteins and show metabolic cooperation and cross talk Despite great advances in the identification and characterisation of essential components and molecular mechanisms associated with the biogenesis and function of organelles information on how organelles interact and are incorporated into metabolic pathways and signaling networks is just beginning to emerge Organelle cooperation requires sophisticated targeting systems which regulate the proper distribution of shared proteins to more than one organelle Organelle motility and membrane remodeling support organelle interaction and contact This contact can be mediated by membrane proteins residing on different organelles which can serve as molecular tethers to physically link different organelles together They can also contribute to the exchange of metabolites and ions or act in the assembly of signaling platforms In this regard organelle communication events have been associated with important cellular functions such as apoptosis antiviral defense organelle division biogenesis ROS metabolism and signaling and various metabolic pathways such as breakdown of fatty acids or cholesterol biosynthesis In this research topic we will focus on recent novel findings on the underlying molecular mechanisms and physiological significance of organelle interaction and cooperation with a particular focus on mitochondria peroxisomes endoplasmic reticulum lysosomes and lipid droplets and their impact on the regulation of cellular homeostasis Our understanding of how organelles physically interact and use cellular signaling systems to coordinate functional networks between each other is still in its infancy Nevertheless recent discoveries of defined membrane structures such as the mitochondria ER associated membranes MAM are revealing how membrane domains enriched in specific proteins transmit signals across organelle boundaries allowing one organelle to influence the function of another In addition to its role as a mediator between mitochondria and the ER contacts between the MAM and peroxisomes contribute to antiviral signaling and specialised regions of the ER are supposed to initiate peroxisome biogenesis whereas intimate contacts between peroxisomes lipid droplets and the ER mediate lipid metabolism In line with these observations it is tempting to speculate that further physical contact sites between other organelles exist Alternatively novel regulated vesicle trafficking pathways between organelles e g mitochondria to peroxisomes or lysosomes have been discovered implying another mode of organelle communication Identifying the key molecular players of such specialised membrane structures will be a prerequisite to understand how organelle communication is physically accomplished and will lead to the identification of new regulatory networks In addition to the direct transmission of interorganellar information cytosolic messenger systems e g kinase phosphatase systems or redox signaling may contribute to the coordination of

organelle functions This research topic will integrate new findings from both modes of communication and will provide new perspectives for the functional significance of cross talk among organelles We would like to thank all the researchers who contributed their valuable work to this research topic Furthermore we are grateful to the reviewers and Associate Editors who contributed valuable comments and positive criticism to improve the contributions

**The impact of spending cuts on science and scientific research** Great Britain: Parliament: House of Commons: Science and Technology Committee,2010-03-25 The pressure to be seen to be making cuts across the public sector is threatening to undermine both the Government's good record on investment in science and the economic recovery Whilst the contribution of a strong domestic science base is widely acknowledged methodological problems with quantifying its precise value to the economy mean that it is in danger of losing out in Whitehall negotiations Scientists are under increasing pressure to demonstrate the impact of their work and there is concern that areas without immediate technology applications are being undervalued The Committee believes the Government faced a strategic choice invest in areas with the greatest potential to influence and improve other areas of spending or make cuts of little significance now but that will have a devastating effect upon British science and the economy in the years to come
