Due to the worldwide importance of rice as a crop plant the biology of rice pests is of great interest to agricultural research This timely book brings together contributions from the fields of entomology agronomy population ecology and biostatistics to provide a comprehensive survey of rice insect interaction Among the topics discussed are crop loss assessment economic thresholds and injury levels for insect pests mosquito leafhoppers and planthoppers population dynamics pheromone utilization techniques for predator evaluation chemical based for insect resistance applications of tissue culture systems analysis and rice pest management With its emphasis on experimental techniques of pest analysis and control **Rice Insects Management Strategies** will be a valuable reference for researchers and practitioners alike **The Economics of Integrated Pest Control in Irrigated Rice** Hermann Waibel, 2012-12-06 As a result of the green revolution the use of

yield increasing inputs such as fertilizer and pesticides became a matter of course in irrigated rice farming in Southeast Asia. Pesticides were applied liberally both as a guarantee against crop failure and as a means of fully utilizing the existing yield potential of the crops. However, since outbreaks of pests such as the brown planthopper BPH or the tungro virus continued to occur despite the application of chemicals, a change of approach began to take place. It is now being realized more and more in Southeast Asia that crop protection problems cannot be resolved solely by the application of chemicals. In the past several years, increasing efforts have therefore been made to introduce as a first step supervised crop protection, leading gradually to integrated pest management. Kranz, 1982. Although the crop protection problems naturally differ in the different developing countries in Southeast Asia, the economic situation prevailing in these countries can nevertheless be regarded as an important common determinant. Pesticide imports use up scarce foreign currency and thus compete with other imports essential to development. For the individual rice farmer, the problem is basically the same: his cash funds are limited and he must carefully weigh whether to use them for purchasing pesticides, fertilizer, or certified seed. In view of this constraint, it is becoming necessary to abandon the purely prophylactic routine calendar spraying and instead employ critically timed and need-based pesticide applications.
