0.075 m 2

b. a zero used as a placeholder in a large 850,000 2

number without a decimal point

In regards to significant figures, in multiplication and division, the final answer is written so it has the same number of digits as the measurement with the fewest significant figures - ANS

Example:

$24.65 \times 0.67 = 16.5155$ 17

four SF two SF calculator display final answer rounded to two SF

What is meant by the "Q" value? - ANS Those individual values that are farthest from the mean are candidates for deletion

(—rejection!) from the data set. For small data sets ($n < 10$), a simple method to determine if an individual value needs to be rejected is the statistical test known as the Q test. In this test, a value for —Q! is calculated and compared to a table of Q values that represent a certain percentage of confidence that the proposed rejection is valid. If the calculated Q value is greater than the value from the table, then the suspect value is rejected and the mean is recalculated. If the Q value is less than or equal to the value from the table, then the calculated mean is reported. —Q! is defined as follows:

$Q = \text{gap} / \text{range}$

where the —gap! is the difference between the suspect value and its nearest neighbor and the —range! is the difference between the questionable value and the value furthest from it.

What is meant by the Average or Mean value? - ANS the sum of the measurements divided by the number of measurements.
