Hans Lambers, Timothy D. Colmer, 2006-02-03 In the last decade enormous progress has been made on the physiology of plant roots including on a wide range of molecular aspects Much of that progress has been captured in the chapters of this book Breakthroughs have been made possible through integration of molecular and whole plant aspects The classical boundaries between physiology biochemistry and molecular biology have vanished There has been a strong focus on a limited number of model species including *Arabidopsis thaliana* That focus has allowed greater insight into the significance of specific genes for plant development and functioning However many species are very different from *A. thaliana* in that they are mycorrhizal develop a symbiosis with N<sub>2</sub> fixing microsymbionts or have other specialised root structures Also some have a much greater capacity to resist extreme environments such as soil acidity salinity flooding or heavy metal toxicities due to specific adaptations Research on species other than *A. thaliana* is therefore pivotal to develop new knowledge in plant sciences in a comprehensive manner This fundamental new knowledge can be the basis for important applications in e.g. agriculture and plant conservation Although significant progress has been made much remains to be learnt It is envisaged that discoveries made in the recent past will likely lead to major breakthroughs in the next decade
