**The Choanoflagellates** Barry S. C. Leadbeater, 2015-01-08 Choanoflagellates have three distinctive claims to fame they are the closest living unicellular relatives of animals they are a major component of aquatic microbial foodwebs and one group is remarkable for its siliceous basket like coverings This landmark book offers a unique synthesis of over forty years of choanoflagellates research Key areas are covered from the phylogenetic evidence supporting the sister group relationship between choanoflagellates and Metazoa to choanoflagellate distribution and diversity in marine and freshwater environments The structure and assembly of choanoflagellate loricae is also presented together with a full discussion of a novel example of regulatory evolution suggesting that the switch from nudiform to tectiform cell division and lorica production was achieved by a sudden reorganisation of existing structures and mechanisms Providing an authoritative summary of what is currently known about choanoflagellates this title will serve as a foundation upon which future research and discussion can take place

**Multicellular Animals** Peter Ax, 2012-12-06 No one can ever have secure knowledge about the gods and creatures and should anyone hit by chance upon the right thing he will not know it for sure that is why everything that we believe to be true is opinion XENOPHANES around 500 B C According to ROD 1988 p 85 The goal of phylogenetic systematics cladistics is to discover the kinship relations between all organisms on earth and to translate the order we perceive in Nature into an equivalent man made system Although the goal is easily formulated the path is thorny and the results achieved continue to be imperfect This is the fate of any science that bases its propositions on the interpretation of historical evidence The diversity found in the millions of species originated as a result of the continuous splitting of biopopulations through time Combined with this was the emergence of hierarchically linked descent communities of species We call the process of origin of descent communities phylogenesis We do not know however the exact course of phylogenesis we can only formulate hypotheses The historical evidence at hand consists of the feature patterns of extant species and of extinct species with their combination of original and derived traits which are the result of evolution
