Polymer Extrusion Pierre G. Lafleur, Bruno Vergnes, 2014-05-09 Extrusion is by far the most important and the oldest processing and shaping method for thermoplastic polymers This process concerns almost all synthetic polymers as well as elastomers or food materials Single screw extrusion is mainly used nowadays to manufacture finished goods or semi finished products More than 90 million tons of thermoplastics are therefore processed every year Twin screw extrusion may be divided into two systems contra rotating systems used within the context of PVC extrusion for the manufacture of pipes or profiles and co rotating systems experiencing nowadays a very significant development because of their significant adaptability and flexibility which enables the manufacture of specific materials polymer alloys thermoplastic elastomers filled polymers nanocomposites Extrusion is carried out by passing molten polymer through a tool called die that will give the product its final shape films and sheets rolled products and electric cables Thanks to the design of dies we obtain at the output a product with controlled dimensions uniform speeds and homogeneous temperatures The book will discuss the same production types but only in the case of coextrusion flows i e multilayer stratified products First of all we will present in this book the physics of the mechanisms at stake then propose more or less complex models in order to describe these mechanisms and then go forward in the interpretation of results and the control of condition flows
