Abstract—Supercritical fluids have a unique and valuable potential for the enhanced processing of many materials. This review describes research in the applications of supercritical fluids to polymer processing. The ability of supercritical carbon dioxide to swell and plasticize polymers is crucial to the impregnation, extraction, and modification of polymeric materials. This plasticization also reduces viscosity and facilitates the processing of polymers due to lower shear stresses. Spectroscopy plays an important role in probing these interactions at a molecular level and to follow in the processes of CO<sub>2</sub>-induced plasticization and the crystallization of polymers. Opportunities exist for improving the processing of many polymeric-based materials ranging from textile to food and biomaterials. The implications of interactions between supercritical carbon dioxide and polymers for drying, dyeing, foaming and extrusion are also discussed with an outlook for further opportunities in this and related areas of polymer processing.

#### I. INTRODUCTION

Supercritical fluids (SCFs) have unique properties that may enhance many types of chemical process operations. An additional advantage of using SCFs stems from the fact that they may replace many environmentally harmful solvents currently used in industry. In particular, SCFs represent an attractive alternative to organic solvents for use as additives in polymer processing. For example, supercritical carbon dioxide (seCO<sub>2</sub>), which is by far the most widely used SCF, is relatively cheap, nontoxic, and nonflammable and has zero ozone-depletion potential. Moreover, the fact that CO<sub>2</sub> is a gas under ambient conditions makes its removal from the polymeric product very easy, avoiding, for example, the costly processes of drying or solvent removal, which is very important in the processing of polymer-based materials.

But what are the properties of an SCF? A supercritical fluid is defined as a substance above its critical pressure and temperature. However, there is still no apparent distinction between a high-pressure gas and an SCF because, under all circumstances, such a fluid will occupy the full volume of its container, demonstrating the typical behavior of a gas. Nevertheless, such a fluid is usually not called a high-pressure gas but a supercritical fluid. The reason is that one cannot liquefy such a fluid under any pressure once it is heated above its critical temperature (it should be noted, however, that it can still be solidified at extremely high pressures!). No phase separation occurs for any substance at pressures or temperatures above its critical values,

thus, one should never see a meniscus once the substance has become supercritical (Fig. 1). In other words, the critical point represents the highest temperature and pressure at which gas and liquid can coexist in equilibrium. However, it is very important to note that this definition is for a pure substance.

Once a small amount of another soluble substance is introduced into the SCF, its critical parameters could change depending on the concentration of the additive. In addition, the critical parameters of the fluid might

Kemmere, Thierry Meyer, 2006-05-12 Recently supercritical fluids have emerged as more sustainable alternatives for the organic solvents often used in polymer processes This is the first book emphasizing the potential of supercritical carbon dioxide for polymer processes from an engineering point of view It develops a state of the art overview on polymer fundamentals polymerization reactions and polymer processing in supercritical carbon dioxide The book covers topics in a multidisciplinary approach starting from polymer chemistry and thermodynamics going through monitoring polymerization processes and ending with

polymer shaping and post processing The authors are internationally recognized experts from different fields in polymer reaction engineering in supercritical fluids The book was initiated by the Working Party on Polymer Reaction Engineering of the European Federation of Chemical Engineering and further renowned international experts Polymer processina usina supercritical fluids Elena Aionicesei, Željko Knez, Mojca Škerget, 2009 The traditional methods for polymer processing use environmentally hazardous volatile organic solvents and chlorofluorocarbons Due to the increase of hazardous solvent emission and generation of aqueous waste streams there is an obvious need of finding new and cleaner methods for the processing of polymers Supercritical carbon dioxide scCO2 has attracted particular attention for these applications due to its tremendous potential as a plasticizer in polymer processing A particular interest is shown to the use of supercritical fluids for processing polymers destined for biomedical applications as microspheres microcapsules foams membranes polymer drug composites The method offers important advantages related to the absence of harmful organic solvents or when necessary the efficient extraction of solvents and impurities the mild processing conditions and the control of particle and foams morphology by simple variation of pressure and temperature Despite the huge potential of scCO2 as a green solvent for processing biocompatible and biodegradable polymers the phase equilibrium data essential for process design are quite scarce Optimum processing techniques and parameters pressure temperature still need consideration and study. The data are especially scarce regarding the scCO2 processing of polymer ceramic composites for biomedical applications On this basis this thesis is aimed to open new perspectives over the use of scCO2 as a green solvent for the processing of biodegradable polymers and composites used as biomaterials Two biodegradable polymers were chosen for this study poly L lactide PLLA and poly D L lactide co glycolide PLGA Their composite with a bioactive ceramic powder hydroxyapatite HA was also studied The main idea followed by this thesis was the obtaining of porous polymeric or composite material scaffolds suitable for tissue engineering under mild temperature conditions and without the use of additional organic solvents. The behavior of the two polymers under dense CO2 had been studied and explained More data about the polymer gas phase equilibrium necessary for understanding and optimizing the effect of processing parameters were obtained by determining the solubility and diffusion coefficients of CO2 in the polymers for certain values of temperature and pressure The solubility of CO2 was measured for each polymer for three different temperatures 308 313and 323 K in the pressure range 10 30 MPa The temperatures were chosen higher than the critical temperature for CO2 but still low enough so as not to affect the bioactivity of any drugs or proteins that could be introduced in the system during processing The same range of temperature and pressure was employed for all tests involving the studied polymers or their composite materials. The efficiency of mixing in the presence of scCO2 for obtaining composite materials from PLLA and HA and respectively PLGA and HA was studied by comparison with coprecipitation The solubility and diffusion coefficient of CO2 in the composite materials were afterward determined and the results were compared with the ones obtained for the polymer alone in order to determine the effect of

the ceramic filler on the gas uptake The possibility of obtaining porous scaffolds was assessed by using a pressure quench technique using dense CO2 as blowing agent with and without the presence of approach. The effect of pressure temperature depressurization rate and porogen on the final porous structure was investigated. The experimental results were compared with literature data and with data obtained by mathematical modeling employing equations of state commonly used for polymersor polymer solvent systems. The results indicate that gas foaming of biodegradable polymers represents a promising technique for obtaining tissue engineering scaffolds with the desired structure Still the processing parameters need to be studied and optimized according to the nature of the substrate and of the aimed final product **Porous Polymer Science** and Applications Inamuddin, Mohd Imran Ahamed, Rajender Boddula, 2022-05-02 Porous Polymer Science and Applications aims to provide recent developments and advances in synthesis tuning parameters and applications of porous polymers This book brings together reviews written by highly accomplished panels of experts working in the area of porous polymers It encompasses basic studies and addresses topics of novel issues concerning the applications of porous polymers Chapter topics span basic studies novel issues and applications addressing all aspects in a one stop reference on porous polymers Applications discussed include catalysis gas storage energy and environmental sectors making this an invaluable guide for students professors scientists and R D industrial experts working in the field of material science and engineering and particularly energy conversion and storage Additional features include Provides a comprehensive introduction to porous polymers addressing design synthesis structure properties and characterization Covers task specific applications of porous polymers Explores the advantages and opportunities of these materials for most major fields of science and engineering Outlines novel research areas and potential development and expansion areas **Foaming with Supercritical Fluids** Ernesto Di Maio, Salvatore Iannace, Giuseppe Mensitieri, 2021-11-06 Foaming with Supercritical Fluids Volume Nine provides a comprehensive description of the use of supercritical fluids as blowing agents in polymer foaming To this aim the fundamental issues on which the proper design and control of this process are rooted are discussed in detail with specific attention devoted to the theoretical and experimental aspects of sorption thermodynamics of a blowing agent within a polymer the effect of the absorbed blowing agent on the thermal interfacial and rheological properties of the expanding matter and the phase separation of the gaseous phase and of the related bubble nucleation and growth phenomena Several foaming technologies based on the use of supercritical blowing agents are then described addressing the main issues in the light of the underlying chemical physical phenomena Offers strong fundamentals on polymer properties important on foaming Outlines the use of supercritical fluids for foaming Covers theoretical points of view including foam formation of the polymer gas solution to the setting of the final foam Discusses the several processing technologies and applications

In this work a three step approach is used to investigate and quantify the physical phenomena associated with CO induced plasticization of polymer melts First a novel experimental apparatus was designed and constructed to measure equilibrium swelling swelling kinetics and diffusion of CO into a polymer melt It was found that diffusion of CO pressure had a negligible effect on the diffusion coefficient however the system temperature directly affected the diffusion coefficient Increased pressure was found to enhance the extent of swelling whereas a maximum was observed with increasing temperature at pressures above 15 MPa The Sanchez Lacombe equation of state was found to be in good agreement with the experimentally calculated variables and thus can be used as a predictive tool to obtain physical properties of the CO PDMS system Secondly a high pressure extrusion slit die rheometer was constructed to measure the viscosity of polymer melts plasticized with low concentrations of CO Polystyrene poly methyl methacrylate polypropylene low density polyethylene and poly vinylidene fluoride were all investigated CO was found to be an efficient plasticizer for all of these polymer materials generally lowering the viscosity of the melt 30 80% depending on processing conditions Predictive viscoelastic scaling models based on free volume principles and a p Biomedical Polymers Mike Jenkins, 2007-09-10 A review of the latest research on biomedical polymers this book discusses natural synthetic
