Random Forests:

Random Forests with R Robin Genuer, Jean-Michel Poggi, 2020-09-10 This book offers an application oriented guide to random forests a statistical learning method extensively used in many fields of application thanks to its excellent predictive performance but also to its flexibility which places few restrictions on the nature of the data used Indeed random forests can be adapted to both supervised classification problems and regression problems In addition they allow us to consider qualitative and quantitative explanatory variables together without pre processing Moreover they can be used to process standard data for which the number of observations is higher than the number of variables while also performing very well in the high dimensional case where the number of variables is quite large in comparison to the number of observations Consequently they are now among the preferred methods in the toolbox of statisticians and data scientists The book is primarily intended for students in academic fields such as statistical education but also for practitioners in statistics and machine learning A scientific undergraduate degree is quite sufficient to take full advantage of the concepts methods and tools discussed In terms of computer science skills little background knowledge is required though an introduction to the R language is recommended Random forests are part of the family of tree based methods accordingly after an introductory chapter Chapter 2 presents CART trees The next three chapters are devoted to random forests They focus on their presentation Chapter 3 on the variable importance tool Chapter 4 and on the variable selection problem Chapter 5 respectively After discussing the concepts and methods we illustrate their implementation on a running example Then various complements are provided before examining additional examples Throughout the book each result is given together with the code in R that can be used to reproduce it Thus the book offers readers essential information and concepts together with examples and the software tools needed to analyse data using random forests

David Garson, 2021-11-29 Data Analytics for the Social Sciences is an introductory graduate level treatment of data analytics for social science It features applications in the R language arguably the fastest growing and leading statistical tool for researchers The book starts with an ethics chapter on the uses and potential abuses of data analytics Chapters 2 and 3 show how to implement a broad range of statistical procedures in R Chapters 4 and 5 deal with regression and classification trees and with random forests Chapter 6 deals with machine learning models and the caret package which makes available to the researcher hundreds of models Chapter 7 deals with neural network analysis and Chapter 8 deals with network analysis and visualization of network data A final chapter treats text analysis including web scraping comparative word frequency tables word clouds word maps sentiment analysis topic analysis and more All empirical chapters have two Quick Start exercises designed to allow quick immersion in chapter topics followed by In Depth coverage Data are available for all examples and runnable R code is provided in a Command

Summary An appendix provides an extended tutorial on R and RStudio Almost 30 online supplements provide information for the complete book books within the book on a variety of topics such as agent based modeling Rather than focusing on equations derivations and proofs this book emphasizes hands on obtaining of output for various social science models and how to interpret the output It is suitable for all advanced level undergraduate and graduate students learning statistical data analysis

Random Forests Yu. L. Pavlov,2019-01-14 No detailed description available for Random Forests [Handbook of Random Forests: Theory and Applications for Remote Sensing](#) Ronny Hansch,2024 This compendium provides a hands on description of random forests The text starts with a consistent introduction of general methods to create train and fuse ensembles of decision trees Instead of limiting the explanation to the general purpose layout of traditional random forests this book outlines specifications during tree creation and training that are especially well suited to analyze structured data such as images The theoretical foundations are explained as deeply as practical and implementation issues The many possible variations of the underlying Random Forest model are discussed as well as their implications on the outcome in order to provide insights into the influence of these parameters and their possible side effects Last but not least this unique title provides specific examples of the usage of Random Forests for analysis tasks of remote sensing imagery

Multi-view Learning with Additive Models on Graphs Mark V. Culp, 2007 *INNOVATIONS OF RANDOM FORESTS FOR LONGITUDINAL DATA* Yaa Tawiah Wonkye, 2019 Ensemble methods have gained attention over the past few decades and are effective tools in data mining An example is the random forest a state of the art ensemble method proposed by Leo Breiman in 2000 Random forest is one of the powerful and widely used machine learning algorithms It is popular for its prediction accuracy and ability to handle large data sets Random forest has many attractive features and can be used for both regression and classification tasks It works well in high dimensional settings as well where the number of features p is larger than the number of observations Cutler Edwards Beard Cutler Hess Gibson and Lawler 2007 However random forest performs poorly if a small number of informative relevant variables are hidden among a great number of noisy irrelevant variables Hastie Tibshirani and Friedman 2001 The presence of irrelevant noise variables adds to the computational burden and it becomes more difficult to train especially when the number of variables exceed the number of observations This research proposes a new development for random forest Our focus is on regression problems as opposed to classification problems The central idea is to construct the random forest using only the features that are relevant and have an influence in predicting the response To achieve this we incorporate feature selection specifically the filter method as a pre processing step into the random forest algorithm We subset the features that are correlated with the response and use the selected features for the construction of random forest To subset the features we use the Pearson product moment correlation to select features that are correlated with the response The proposed method begins by identifying the features that are useful in predicting the response and then constructing the random forest using only the selected features One advantage of our approach is that only relevant features are used in the construction of the random forest and simulation results show that combining feature selection with random forest regression achieves better prediction accuracy Although this is done at a cost of losing information the convergence rate is faster since it depends only on the relevant variables Our method is computationally efficient and advantageous compared to other methods In addition we extend the proposed method to longitudinal data Longitudinal data arises when measurements are taken repeatedly for the same individual over a period of time Fitzmaurice Laird and Ware 2004 At different time points measurements are collected for each individual In our formulation we construct a random forest for each time point and then investigate the effect of subsetting features prior to the construction of the random forest At the very end of this dissertation a brief conclusion is given and some possible further improvements are discussed
