INTRODUCTION

Rarefied gas dynamics is a diverse field, encompassing, for example, high-altitude hypersonic flow fields, the reflective and reactive characteristics of gases interacting with solid and liquid surfaces, energy-transfer phenomena in molecular collisions, aerosol dynamics, cluster formation and topology, flows induced by evaporation and condensation, upper-atmospheric dynamics, and the attainment of milli-Kelvin temperatures by flow cooling techniques. Other subjects in the field include vacuum-pump performance, spacecraft contamination, a variety of interactions due to thruster plumes, spacecraft charging, and gas and isotope separations. Underlying all of these subjects is the central theme of the field of rarefied gas dynamics: the study of gas flow phenomena in which the discrete molecular nature of the gas cannot be safely ignored. The field has a rich heritage of analysis applied to the study of flows where concepts and techniques related to nonequilibrium statistical mechanics are important. An equally respected tradition is the development and application of instrumentation techniques that can be used to study the details of molecular motion in gas flows, as well as to study flow-generated populations of internal energy states and the characteristics of gases after surface encounters.

Rarefied gas dynamics is founded on the pioneering work in the kinetic theory of gases begun in the latter half of the nineteenth century, which has continued to the present. What today we call rarefied gas dynamics was discussed as early as 1934 by Zahm (1934), but research began in earnest shortly after World War II (Tsien 1946). Because of growing interest in space and flight at extreme altitude, attention was drawn to a flow regime that had not been seriously considered as a concern of either aerodynamics or gas dynamics. In this flow regime, the molecular mean free path in the gas, λ , becomes significant compared with either a charac-

Progress in Aeronautical Sciences D. Küchemann, L. H. G. Sterne, 2016-07-04 Progress in Aeronautical Sciences Volume 6 reviews advances in aeronautical sciences and considers a wide range of problems related to aerodynamics including some classical problems of fluid motion and those affecting hypersonic aircraft Topics covered range from equations of gas flow at low density nonequilibrium expansion flows of dissociated oxygen and ionized argon around a corner and the role of spatially growing waves in the theory of hydrodynamic stability This volume is comprised of five chapters and begins with a discussion on flows of gases where the density of the gas is too low for equations of continuum gas dynamics to be applicable The kinetic theory of gases is used to derive the equations governing such flows The second chapter deals with the nature of shock waves in flows of electrically conducting gases subjected to magnetic fields The third chapter is concerned with the theory of two dimensional flows of dissociated oxygen or ionized argon expanding around a corner The fourth chapter goes back to the classical problem of hydrodynamic stability and the possible mechanics underlying the transition from the laminar to a turbulent state of the flow The last chapter describes a future type of aircraft that can fly at hypersonic speeds This book will be a useful resource for students and practitioners in the field of aeronautics Advances in Atomic and Molecular Physics ,1965-01-01 Advances in Atomic and Molecular Physics *Berkeley, California, 1960.* *Rarefied Gas Dynamics.
