Physical Methods In Agriculture Approach To Precision And Quality:

Physical Methods in Agriculture Jirí Blahovec, Miroslav Kutílek, 2012-12-06 The first attempts to use physical methods in agriculture can be found in nineteenth century as a necessary component of farm and food machinery. There were mechanics, electricity and physical chemistry that were the first physical disciplines used in agriculture and food industry. In the same time period the studies on physical properties of soils started to be one of main topics of soil science. The twentieth century was a century of research on physical properties of agromaterials. The physical properties of agromaterials have been studied e.g. in the USA where a big role has been played by ASAE 1907 and in the Soviet Union where the special Institute of Agrophysics was founded 1932 by Academician Ioffe. The ASAE's activity was enlarged in 1960s and 1970s especially with the role playing by the Mohsenin's group and its followers. At that time the Institute of Agrophysics of Polish Academy of Sciences was founded in Lublin and conferences on physical methods in agriculture began to be organised. The participants of the last conference *Physical Methods in Agriculture Approach to Precision and Quality* held on August 27-30 2001 have prepared the basis for this book. Part of the conference participants decided to enlarge their conference papers to be more general and more instructive in relation to further development of the science. New papers prepared under this decision were reviewed, discussed and revised repeatedly to be presented in this book. *Physical Methods in Agriculture* Jirí Blahovec, Martin Libra, 2001. *Physical Methods in Agriculture* Česká zemědělská univerzita v Praze, 2001.

The 239 revised full papers and 14 short papers presented at 33 workshops were carefully reviewed and selected from 849 submissions. They are organized in five thematical tracks: computational methods, algorithms and scientific applications, high performance computing and networks, geometric modeling, graphics and visualization, advanced and emerging applications and information systems and technologies.

Minimally Processed Refrigerated Fruits and Vegetables Fatih Yildiz, Robert C. Wiley, 2017-05-11 The first edition of *Minimally Processed and Refrigerated Fruits and Vegetables* edited by Robert C. Wiley and Fatih Yildiz was published in 1994. At the time of publication this was a new concept and was well received by the scientific community. Minimally processed foods are whole plant tissues; the identity of the plant tissue is recognized by consumers which may contain active enzymes, live tissues and plant cells. These are some of the basics for the healthy food design. The overall function of these foods is to provide convenient, ready to serve, ready to cook, free of any pesticides and contaminants like fresh products for food service and retail consumers. Minimally Processed and Refrigerated Foods (MPR) have been popular in many countries. The following are some of the advantages offered by MPR produce foods: 1. Ease of portion control in the food service industry; 2. Lower

transportation cost all inedible portions of the produce are removed prior to transportation 3 No waste is generated at the point of consumption 4 Utilization and recycling of the waste is much easier 5 Value added new fruit and vegetable products and meal development is possible and easy 6 No requirement is needed for phytosanitary control during trade 7 No glycation end products formation during processing 8 Degree of food processing is minimized for optimal health of human the processing plant for MPR produce which is not addressed in any other books on this topic will be described in this second edition Also comparison of minimal processing technologies with other technologies was explained in the first publication and will be updated in this second edition During the last 200 years the purpose of food processing was a safety sterilization Pasteurization 1804 Nicholas Apert Pasteur 1867 and b prevention of deficiency diseases Enrichments but MPR foods provides a two new dimensions to food processing a Prevention of chronic diseases bioactive compounds and b Optimum health functional foods Superfoods Nutraceuticals and Medical foods for human Infrared Thermography Recent Advances and Future Trends Carosena Meola,2012-08-03 Infrared thermography IRT is a non contact non invasive methodology which allows for detection of thermal energy that is radiated from objects in the infrared band of the electromagnetic spectrum for conversion of such energy into a visible image such as a surface temperature map This feature represents a great potential to be exploited in a vast variety of fields from aerospace to civil engineering to medicine to agriculture etc However IRT is still not adequately enclosed in industrial instrumentation and there are still potential users who might benefit from the use of such a technique and who are not aware of their existence This e book conveys information about basic IRT theory infrared detectors signal digitalization and applications of infrared thermography in many fields such as medicine foodstuff conservation fluid dynamics architecture anthropology condition monitoring non destructive testing and evaluation of materials and structures The volume promotes an exchange of information between the academic world and industry and shares methodologies which were independently developed and applied in specific disciplines

Nowadays the world is facing food shortages with the increasing global population decreasing food sources and deteriorating environment. Traditionally several strategies have been employed to improve agricultural production including physical methods e.g. seed priming, stratification, scarification and ultrasound and chemical methods e.g. disinfectants, fungicides, hormones and fertilizers. However, most of these methods have their own limitations. For example, some methods require expensive and sophisticated equipment and some approaches are inefficient, time consuming and impractical. The current agricultural production relies on a large number of chemical fertilizers, pesticides and some other chemicals to guarantee high agricultural output, which inevitably causes environmental pollution and directly threatens human health. Recently, number of emerging sustainable and green technologies such as atmospheric cold plasma, ion beams and nanoparticles are becoming increasingly popular in agriculture, which can be applied in seed sterilization, plant disease control, improvement of seed germination and seedling growth and enhancement of plant resistance against various stresses. These technologies can be promising alternatives to conventional methods for improving crop yields. However, the mechanisms underline the biological effects induced by the emerging sustainable and green technologies are still unclear.
