TBI may affect 10 million people worldwide. It is considered the signature wound of the conflicts in Iraq and Afghanistan. These injuries result from a bump or blow to the head or from external forces that cause the brain to move within the head, such as whiplash or exposure to blasts. TBI can cause an array of physical and mental health concerns and is a growing problem, particularly among soldiers and veterans because of repeated exposure to violent environments. One form of treatment for TBI is cognitive rehabilitation therapy (CRT), a patient-specific, goal-oriented approach to help patients increase their ability to process and interpret information. The Department of Defense asked the IOM to conduct a study to determine the effectiveness of CRT for treatment of TBI.

**Rehabilitation for Traumatic Brain Injury** Maggie Campbell, 2000. This textbook is designed for those who have head-injured clients as part of their caseload but have little or no specialist training or experience in this area. In other words, those who work outside of specialist units. It aims to help the reader develop a deeper understanding of the pathology and effects of any significant traumatic insult to the brain. The emphasis is on the long-term and continuing deficits of these clients, which require ongoing rehabilitation rather than on the acute, immediate post-injury aspects of care, which are usually dealt with in special units. The content focuses on the general principles and issues involved rather than on the clinical details of care. It will help give those working in this area an understanding of the importance of their role in the ongoing rehabilitation process.
