

FIBRE OPTICS

Introduction:

An optical fiber is a flexible, transparent fiber made of high quality glass (silica) or plastic, slightly thicker than a human hair. It can function as a waveguide, or "light pipe", to transmit light between the two ends of the fiber. The branch of physics which deals with the transmission and reception of light waves using optical fibers, which acts as guiding media, is known as fiber optics.

STRUCTURE OF AN OPTICAL FIBRE:

The basic structure of an optical fiber consists of three parts; the core, the cladding, and the buffer or protecting skin. Light propagates mainly along the core of the fiber. The core is generally made of glass. The refractive index of core is represented by n_1 its typical value is 1.62. The core is surrounded by a layer called the cladding with less refractive index than core. The cladding is generally made of glass/plastic. The refractive index of cladding is represented by n_2

its typical value is 1.52. For extra protection, the cladding is enclosed in an additional layer called buffer. The buffer is a layer of material used to protect an optical fiber from physical damage.

PRINCIPLE OF AN OPTICAL FIBRE

The light launched inside the core through its one end propagates to the other end due to **total internal reflection** at the core-cladding interface. This is the principle of optical fiber. Total internal reflection at the fiber wall can occur only if the following two conditions are met.

1. The refractive index of the core material n_1 must be higher than that of the cladding n_2 .
2. At the core-cladding interface the angle of incidence i must be greater than critical angle.

Handbook & Buyers Guide , **Fluoride Glass Optical Fibres** P.W. France, 2012-12-06 One of the most exciting prospects for optical fibres made from fluoride glasses is the possibility of providing long distance optical communication systems without the need for repeaters This objective has stimulated much of the work into fluoride glasses over the past ten years and has prompted the writing of this book It has also emerged that fluoride fibres can transmit both visible and infrared energy from about 0.5 to 5 μm and that they have many applications outside the field of telecommunications These include optical fibre sensors particularly in remote infrared spectroscopy laser surgery and fibre lasers Several companies are now established in the field and good quality fluoride fibres are available from sources throughout the USA Europe and Japan Moreover the first commercial instruments based on fluoride fibres are finding their way to the market place and these fibres will undoubtedly form the basis of many more instruments yet to be developed The work presented in this book represents the field both from an academic understanding of the materials and ways to convert them into fibre and from a practical and commercial viewpoint The principal author and some of the co authors are based at the British Telecom Research Laboratories in the UK **Fiber Optics Yellow Pages** , **Specialty Optical Fibers Handbook** Alexis Mendez, T.
