## **Physics And Modelling Of Wind Erosion:**

**Physics and Modelling of Wind Erosion** Yaping Shao, 2008-10-13 Wind erosion occurs in many arid semiarid and agricultural areas of the world. It is an environmental process influenced by geological and climatic variations as well as human activities. In general, wind erosion leads to land degradation in agricultural areas and has a negative impact on air quality. Dust emission generated by wind erosion is the largest source of aerosols which directly or indirectly influence the atmospheric radiation balance and hence global climatic variations. Strong wind erosion events such as severe dust storms may threaten human lives and cause substantial economic damage. The physics of wind erosion is complex as it involves atmospheric soil and land surface processes. The research on wind erosion is multidisciplinary covering meteorology and fluid dynamics, soil physics, colloidal science, surface soil hydrology, ecology, etc. Several excellent books have already been written about the topic, for instance by Bagnold (1941) *The Physics of Blown Sand and Desert Dunes*, Greeley and Iversen (1985) *Wind as a Geological Process on Earth, Mars, Venus, and Titan*, Pye (1987) *Aeolian Dust and Dust Deposits*, Pye and Tsoar (1990) *Aeolian Sand and Sand Dunes*. However, considerable progress has been made in wind erosion research in recent years and there is a need to systematically document this progress in a new book.

**Treatise on Geomorphology**, 2013-02-27 The changing focus and approach of geomorphic research suggests that the time is opportune for a summary of the state of the discipline. The number of peer-reviewed papers published in geomorphic journals has grown steadily for more than two decades and more importantly, the diversity of authors with respect to geographic location and disciplinary background (geography, geology, ecology, civil engineering, computer science, geographic information science, and others) has expanded dramatically. As more good minds are drawn to geomorphology and the breadth of the peer-reviewed literature grows, an effective summary of contemporary geomorphic knowledge becomes increasingly difficult. The fourteen volumes of this *Treatise on Geomorphology* will provide an important reference for users from undergraduate students looking for term paper topics to graduate students starting a literature review for their thesis work and professionals seeking a concise summary of a particular topic. Information on the historical development of diverse topics within geomorphology provides context for ongoing research. Discussion of research strategies, equipment, and field methods, laboratory experiments, and numerical simulations reflect the multiple approaches to understanding Earth's surfaces and summaries of outstanding research questions highlight future challenges and suggest productive new avenues for research. Our future ability to adapt to geomorphic changes in the critical zone very much hinges upon how well landform scientists comprehend the dynamics of Earth's diverse surfaces. This *Treatise on Geomorphology* provides a useful synthesis of the state of the discipline as well as highlighting productive research directions that educators and students, researchers will find useful. Geomorphology has advanced greatly in the last 10 years to become a very interdisciplinary field. Undergraduate students looking for term paper topics to graduate students starting a literature review for their thesis work and professionals seeking a concise summary of a particular topic will find the answers.
