

The background of the cover features a stylized atomic model. It consists of two central dark blue spheres representing nuclei. One nucleus is positioned in the upper half of the image against a light purple background, while the other is in the lower half against a teal background. Thin, curved lines represent electron orbits, looping around both nuclei and crossing each other. The overall design is minimalist and scientific.

Physics Of Solar System Plasmas:

Physics of Solar System Plasmas Thomas E. Cravens, 2004-11-11 *Physics of Solar System Plasmas* provides a comprehensive introduction to the plasma physics and magnetohydrodynamics that are needed to study the solar wind and magnetosphere. The text includes a broad introduction to plasma physics including important discussions of kinetic theory, single particle motion, magnetohydrodynamics, geomagnetically trapped energetic particles, and the physics of magnetic reconnection. This leads into a thorough description of the Sun and the solar wind, and finally the author addresses magnetospheric physics. Among the topics covered here are magnetospheric morphology, bow shocks, magnetospheric convection, and electrical currents, substorms, ionospheric physics, magnetosphere-ionosphere coupling, auroral physics, and the interaction of the solar wind with the planets. Problem sets at the end of each chapter make this a useful text for advanced undergraduate students in astrophysics, geophysics, or atmospheric sciences. Graduate students and researchers will also find it a valuable source of information. Understanding the Sun and Solar System Plasmas National Research Council (U.S.). Solar System Magnetic Fields E.R. Priest, 2012-12-06 In September 1984 a Summer School on Solar System Plasmas was held at Imperial College with the support of the Science and Engineering Research Council. An excellent group of lecturers was assembled to give a series of basic talks on the various aspects of the subject aimed at Ph D students or researchers from related areas wanting to learn about the plasma physics of the solar system. The students were so appreciative of the lectures that it was decided to write them up as the present book. Traditionally different areas of solar system science such as solar and magnetospheric physics have been studied by separate communities with little contact. However it has become clear that many common themes cut right across these distinct topics such as magnetohydrodynamic instabilities and waves, magnetic reconnection, convection, dynamo activity, and particle acceleration. The plasma parameters may well be quite different in the Sun's atmosphere, a cometary tail, Jupiter's magnetosphere, but many of the basic processes are similar, and it is by studying them in different environments that we come to understand them more deeply. Furthermore, direct in situ measurements of plasma properties at one point in the solar wind or the magnetosphere complement the more global view by remote sensing of a similar phenomenon at the Sun.
