TRANSMISSION OF NOISE

•A noise generally consists of three inter-related elements- the source, the receiver and the transmission path.

•The transmission path is usually the atmosphere through which the sound is propagated, but can include the structural materials of any building containing the receiver.

•Any noise, whether of any origin, is transmitted through walls, frames, ceilings or floors or through air. Noise is transmitted in following 3 ways:

- ✓ Air borne noise: transmission through air
- ✓ Structural borne noise: transmission through the structural members
- ✓ By vibration of structural member

Structural borne noise

- In this type elastic wave motion is set.
- Compressions and rarefactions of sound are transmitted from particle to particle in the structure in the form of pressure impulse and are conveyed through it to the other side.

By vibrations of structural members

- Some sound waves strike on partition or membrane
- walls, which vibrate and their twin

Air borne noise

- Generated in the air and transmitted through air.
