Physiology Of Excitable Cells:

The Physiology of Excitable Cells Alan Grinnell, William James Moody, 1983 **The Physiology of Excitable Cells** David J. Aidley, 1998-09-03 The fourth edition of this highly successful text has been extensively revised and restructured to take account of the many recent advances in the subject and bring it right up to date The classic observations of recent years can now be interpreted with the powerful new techniques of molecular biology Consequently there is much new material throughout the book including many new illustrations and extensive references to recent work Its essential philosophy remains the same though fundamental concepts are clearly explained and key experiments are examined in some detail This textbook will be used by students of physiology neuroscience cell biology and biophysics Specializing undergraduates and graduates as well as lecturers and researchers will find the text thorough and clearly written The Physiology of Excitable Cells D. J. Aidley, 1973 **The physiology of excitable cells** David J. Aidley, 1971 Physiology of Non-Excitable Cells J. Salánki, 2013-10-22 Advances in Physiological Sciences Volume 3 Physiology of Non Excitable Cells is a collection of papers presented at the 28th International Congress of Physiology held in Budapest on July 13 19 1980 This book is organized into five parts encompassing 36 chapters that cover the various physiological aspects of non excitable cells and neuronal membranes The first two parts describe cellular models of iso osmotic and epithelial transport The third part highlights the relationship between cell transport and cellular metabolism This part also deals with the genetic and hormonal control of cellular transport as well as the lipoprotein synthesis and secretion by hepatocyte The fourth part explores cell to cell communication through junctional membrane channels and calmodulin The fifth part examines the temporal structure of biological systems in the sub second time domains This book will be of value to physiologists cell biologists researchers and biology students The Physiology of Excitable Cells David J. Aidley, 1973 **Textbook of Physiology** Harry D. Patton, 1989 **An Introduction to Mathematical Modeling in Physiology, Cell Biology, and Immunology** James Sneyd, 2002 In many respects biology is the new frontier for applied mathematicians This book demonstrates the important role mathematics plays in the study of some biological problems It introduces mathematicians to the biological sciences and provides enough mathematics for bioscientists to appreciate the utility of the modelling approach The book presents a number of diverse topics such as neurophysiology cell biology immunology and human genetics It examines how research is done what mathematics is used what the outstanding questions are and how to enter the field Also given is a brief historical survey of each topic putting current research into perspective The book is suitable for mathematicians and biologists interested in mathematical methods in biology Physiology of Non-excitable Cells János Salánki, 1981 Textbook of physiology Harry D. Patton, Advances in Physiological Sciences: Physiology of excitable cells , 1981 Introduction To The Neurophysiology Of Movement Andrew J Fuglevand, 2025-06-24 This introductory textbook explores how the brain and spinal cord regulate movement It is designed for senior undergraduate and early stage graduate or clinical students in

movement sciences physiology neuroscience biomedical engineering physical therapy occupational therapy rehabilitation sciences and speech sciences The book begins by presenting the fundamentals of cellular neurophysiology in a conceptual and accessible manner It then explores key principles of sensory processing using the somatosensory system as both a model system and a fundamental component of movement control The motor system is discussed in detail starting with the periphery focusing on the motor unit and progressing to motor areas in the cerebral cortex cerebellum and basal ganglia The roles of these regions are examined within the framework of three broad categories of movement reflexes rhythmic behaviours and voluntary movements The book also discusses various neurological disorders affecting movement and outlines current therapeutic approaches *Physiology of Excitable Membranes* J. Salánki, H. Meves, N.

Chalazonitis, 2013-10-22 *Physiology of Excitable Membranes* contains plenary lecture and most of the papers presented at five symposia of the Section General Cell Physiology at the 28th International Congress of Physiological Sciences Organized into 44 chapters this book begins with a discussion on the ionic mechanisms of excitability of nerve cells Subsequent chapters focus on charge movement in nerve membrane calcium electrogenesis optical changes during electrogenesis synaptic transmission and modulation and transmission in autonomic ganglia *Modeling Excitable Tissue* Aslak

Tveito, Kent-Andre Mardal, Marie E. Rognes, 2020-10-30 This open access volume presents a novel computational framework for understanding how collections of excitable cells work The key approach in the text is to model excitable tissue by representing the individual cells constituting the tissue This is in stark contrast to the common approach where homogenization is used to develop models where the cells are not explicitly present The approach allows for very detailed analysis of small collections of excitable cells but computational challenges limit the applicability in the presence of large collections of cells **Structure and Function in Excitable Cells** Donald Cheng, 2013-11-11 This book is a collection of up

to date research reviews dealing with various aspects of the structure and function of excitable cells Its overall objective is to further the search for a better understanding of the mechanism of excitation on a structural and physicochemical basis The chapters are written by active investigators from a variety of disciplines representing many different points of view Their complementary fields of expertise give this book the rare feature of extraordinary breadth Excitability is a fundamental property of many biological systems The mechanisms by which nerve impulses are initiated and propagated and by which rhythmical activities are produced in nerve muscle and cardiac cells can be fully elucidated only when the process of excitation is derived from fundamental principles applied to known structural forms at both the macroscopic and the molecular level The problems of excitation are complex requiring knowledge of many aspects of cells including their morphology electrophysiology chemical physics and biochemistry **The Molecular Properties and Evolution of Excitable Cells** C. J. Duncan, 2013-10-22 *The Molecular Properties and Evolution of Excitable Cells* describes the theoretical aspects in which excitable cells such as nerves muscles and sense organs operate This book develops a hypothesis regarding the

evolution and characteristics of excitable cells This monograph focuses on the properties of the bounding membrane and its complex permeability system which starts the excitation state Sense organs as the input component in both vertebrates and invertebrates are then discussed The text then briefly describes the ways that the ionic permeability of the excitable membrane can both be modified and controlled The book points out that since ions pass through standard sizes of the pores in an excitable membrane their passage is determined by the dimensions of the pore and by the existing charge found on its walls The book then explains the application of a mechanical stimulus to a mechanoreceptor that will cause deformations in the membrane This deformation leads to enzyme activity and produces alteration in the rate at which ATP is supplied to the lateral borders of the cell The text discusses a hypothesis that invokes enzyme activity by propagating action potential along the axon and other input systems such as adrenaline amino acids and γ amino butyric acid GABA The book also explains the hypothesis that living organisms are composed of an ordered system of protein enzymes forming on phospholipid protein membranes This monograph will benefit microbiologists biotechnologists and academicians connected with the biological sciences *Journal of Cellular Biochemistry* ,1983 Electro-physiology Wilhelm Biedermann,1896 **Cardiac Electrophysiology Methods and Models** Daniel C. Sigg,Paul A. Iaizzo,Yong-Fu Xiao,Bin He,2010-09-11 Cardiovascular disease is the major cause of mortality and morbidity in the Western Hemisphere While significant progress has been made in treating a major sub category of cardiac disease arrhythmias significant unmet needs remain In particular every day thousands of patients die because of arrhythmias in the US alone and atrial fibrillation is the most common arrhythmia affecting millions of patients in the US alone at a given time Therefore there is a public need to continue to develop new and better therapies for arrhythmias Accordingly an ever increasing number of biomedical pharmaceutical and medical personnel is interested in studying various aspects of arrhythmias at a basic translational and applied level both in industry ie Biotech Pharmaceutical and device and in academia Not only has our overall understanding of molecular bases of disease dramatically increased but so has the number of available and emerging molecular pharmacological or device treatment based therapies This practical state of the art handbook will summarize and review key research methods and protocols their advantages and pitfalls with a focus on practical implementation and collaborative cross functional research The volume will include visual and easy to use graphics bulleted summaries boxed summary paragraphs links to reference websites equipment manufacturers where appropriate photographs of typical experimental setups and so forth to keep this book very focused on practical methods and implementation and yet provide enough theory that the principles are clearly understood and can be easily applied **The Biophysical Basis of Excitability** Hugo Gil Ferreira,M. W. Marshall,1985-10-31 Defines the basic concepts from biology mathematics physics and chemistry that are needed to understand how excitable cells function Applies them specifically to the study of membrane transport artificial membranes signal capturing and analysis in biological systems
