Recent Advances In Psoriasis The Role Of The Immune System:

From Arsenic to Biologicals Barbara S. Baker, 2008 Psoriasis is an ancient disease that was probably first described by Hippocrates more than 400 years BC In the Middle Ages psoriasis was confused with leprosy a situation that lasted until the beginning of the 19th century when psoriasis was finally recognised as being a specific clinical entity From Arsenic to Biologicals A 200 year History of Psoriasis is a chronological description of how the unravelling of the mechanisms underlying psoriasis have led to a change from the empirical try it and see treatments of the 19th and early 20th centuries to the evidence based treatments of the present day The book describes the various theories proposed to explain psoriasis and the introduction of new treatments decade by decade throughout the 20th century These range from the belief that psoriasis resulted from an internal metabolic disturbance in the 19th century when arsenic was the systemic treatment of choice through to the 21st century when the recognition that psoriasis was a disease of the immune system enabled the development and use of therapeutic biological agents This book would be of interest to individuals with psoriasis dermatologists or skin researchers or anyone studying the history of medicine Psoriasis - Recent Advances in Diagnosis and Treatment

Pierre Vereecken, 2024-09-04 Psoriasis a chronic autoinflammatory skin condition significantly impacts quality of life Its prevalence peaks at 2% in Northern countries Thus it is imperative to examine what practitioners can discern from psoriatic patients ranging from the typical chronic plaque psoriasis to other manifestations Recognizing these signs promptly can bring relief to patients and ensure optimal support Treatment decisions must strike a balance between benefits and side effects with patient empowerment being crucial for them to manage their lives effectively This book offers readers regardless of their specialty the chance to view psoriatic patients from a different perspective acknowledging that these patients require more than just pharmacological interventions **Model of pathogenesis of psoriasis. Part 1. Systemic psoriatic process. , Model of pathogenesis of psoriasis. Part 2. Local processes. , Skin Immune System (SIS)**

Jan D. Bos, 1997-04-10 Immunodermatology is a field covering the majority of skin diseases including the most prevalent ones in the general population The Second Edition of Skin Immune System SIS discusses immune mediated skin diseases and disease groups in which the SIS plays a role It covers major findings in immunophysiology and immunopathology that have occurred since the introduction of the First Edition in 1990 As the subtitle indicates the Second Edition adds a new emphasis on cutaneous immunology and also includes new information on immune based therapeutic interventions and methods such as phototherapy and the immunological therapy of skin cancer The book contains Part I with introductory chapters Part II with descriptions of the cellular elements and Part III which describes the humoral and molecular components of SIS Part IV follows to integrate the facts described in Parts II and III into concepts of pathophysiology It contains a number of concepts entitled response patterns that describe how the constitutional elements of SIS work together New in this edition are the descriptions of immunodermatological diseases individually described in Part V Part VI is also all new and summarizes

principles of immunotherapy *Recent Advances in Potential Biomarkers for Rheumatic Diseases and in Cell-based Therapies in the Management of Inflammatory Rheumatic Diseases* Eric Toussiro, Katarzyna Bogunia-Kubik, Philippe Saas, 2022-02-18 **Recent Advances In Psoriasis: The Role Of The Immune System** Barbara S Baker, 2000-04-11 This book presents the evidence for the belief that psoriasis is a disease of abnormal keratinocyte proliferation induced by T cells. The latest approaches to investigating the immunopathogenesis of this disease and a review of previous findings are presented to give an overall picture of the current knowledge in this field. Each topic is discussed in detail, clearly illustrated and well referenced. The book should prove invaluable to clinical dermatologists and researchers in the fields of immunology and dermatology who have an interest in skin diseases.

Recent Advances in $\gamma\delta$ T Cell Biology: New Ligands, New Functions, and New Translational Perspectives Dieter Kabelitz, Julie Dechanet-Merville, 2016-02-16 $\gamma\delta$ T cells are a small subset of T lymphocytes in the peripheral circulation but constitute a major T cell population at other anatomical localizations such as the epithelial tissues. In contrast to conventional T cells, the available number of germline genes coding for T cell receptor (TCR) variable elements of T cells is very small. Moreover, there is a preferential localization of T cells expressing given $V\gamma$ and $V\delta$ genes in certain tissues. In humans, T cells expressing the $V\gamma 9V\delta 2$ encoded TCR account for anywhere between 50 and 95% of peripheral blood T cells, whereas cells expressing non $V\delta 2$ genes dominate in mucosal tissues. In mice, there is an ordered appearance of T cell waves during embryonic development, resulting in preferential localization of T cells expressing distinct $V\gamma/V\delta$ genes in the skin, the reproductive organs or gut epithelia. The major function of T cells resides in local immunosurveillance and immune defense against infection and malignancy. This is supported by the identification of ligands that are selectively recognized by the TCR. As an example, human $V\gamma 9V\delta 2$ T cells recognize phosphorylated metabolites, phosphoantigens that are secreted by many pathogens but can also be overproduced by tumor cells, providing a basis for a role of these T cells in both anti-infective and anti-tumor immunity. Similarly, the recognition of endothelial protein C receptor by human non $V\delta 2$ T cells has recently been identified to provide a link for the role for such T cells in immunity against epithelial tumor cells and cytomegalovirus-infected endothelial cells. In addition to classical functions such as cytokine production and cytotoxicity, recent studies suggest that subsets of T cells can exert additional functions such as regulatory activity and quite surprisingly, professional antigen-presenting capacity. It is currently not well known how this tremendous extent of functional plasticity is regulated and what is the extent of TCR ligand diversity. Due to their non-MHC-restricted recognition of unusual stress-associated ligands, T cells have raised great interest as to their potential translational application in cell-based immunotherapy. Topics of this Research Focus include molecular insights into the activation and differentiation requirements of T cells, role of pyrophosphates and butyrophilin molecules for the activation of human T cells, role of T cells in tumor immunity and in other infectious and non-infectious diseases and many others. We are most grateful to all colleagues who agreed to write a
