When to clamp the umbilical cord at birth is the controversial topic examined in this study on placental transfusion. The authors provide in-depth discussions on the mechanisms that regulate placental transfusion and on the consequences of placental transfusion on the newborn infants blood volume as well as the infant's adaptation to the extrauterine environment. Divided into five sections, the text covers general considerations, definitions and methods, blood volume distribution, and magnitude; mechanisms of placental transfusion including uterine contraction, patency of the umbilical vessels, gravity, and respiration; blood volume adjustment during the first hours of perinatal life; and the effects of placental transfusion on extrauterine circulation and respiratory adaptation, renal function, and appearance and behavior. The final section gives special consideration to such perinatal complications as asphyxia, low birth weight, respiratory distress syndrome, maternal diabetes, hydropic fetuses, hypernatremia, polycythemia, and hyperviscosity.
