Aeronautical engineers concerned with the analysis of aircraft dynamics and the synthesis of aircraft flight control systems will find an indispensable tool in this analytical treatment of the subject Approaching these two fields with the conviction that an understanding of either one can illuminate the other the authors have summarized selected interconnected techniques that facilitate a high level of insight into the essence of complex systems problems These techniques are suitable for establishing nominal system designs for forecasting off nominal problems and for diagnosing the root causes of problems that almost inevitably occur in the design process A complete and self contained work the text discusses the early history of aircraft dynamics and control mathematical models of linear system elements feedback system analysis vehicle equations of motion longitudinal and lateral dynamics and elementary longitudinal and lateral feedback control The discussion concludes with such topics as the system design process inputs and system performance assessment and multi loop flight control systems Originally published in 1974 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905      Student Guide for Advanced First-term Avionics Course, Class A1, C-100-2010 , 1985      **Servomechanisms and Regulating System Design: The automatic control problem** Harold Chestnut, Robert W.
