Sets Events Switching:

Nonblocking Electronic and Photonic Switching Fabrics Wojciech Kabacinski, 2005-12-06 Switching fabrics first appeared in telephone exchanges where there was a need to interconnect many pairs of telephones installed in the network. Due to the large number of connected subscribers and inter-exchange links, switching fabrics in telephone exchanges have to serve a great number of input and output ports. Because of the scale, large switching fabrics were constructed from smaller ones. The way of building switching fabrics from elements of smaller capacity and different characteristics of switching fabrics topologies has been for a long time a rich area of theoretical research. The seminal work is due to C. Clos [23] who first considered multistage strict sense nonblocking switching networks and V. E. Benes [9] who first introduced the mathematical theory of switching networks. From that time many research was conducted in this field. Switching fabrics found its application not only in telecommunication starting from telephone exchanges through ATM switches and IP routers to optical cross connect systems and optical packet switches but also in other areas of knowledge like computation and control. Theory of switching fabrics becomes also a part of applied mathematics. Results of studies carried out by researchers from these areas were published in numerous papers and some books. This book is intended for people interested in the switching theory and especially combinatorial characteristics of switching networks. It contains a considerable amount of already known results. Some of them are presented in more detailed form, other are only mentioned. *The Resource Transfer Problem* Illa Weiss, 2018-12-18 The resource transfer problem (RTP) is a modeling and solution framework for integrated complex scheduling and rich vehicle routing problems. It allows the modeling of a wide variety of scheduling problems, vehicle routing problems, their combination with integrated problems as well as various specific requirements and restrictions arising in practical scheduling and vehicle routing. Based on the unifying resource transfer problem framework, this book proposes a generic constraint propagation approach that exploits the specific structure of scheduling and routing problems. *Secret Oracle - Unleashing the Full Potential of the Oracle DBMS by Leveraging Undocumented Features* Norbert Debes, 2008-03 Secret ORACLE is the definitive guide to undocumented and partially documented features of the ORACLE database server. This book will improve your efficiency as an ORACLE database administrator and enable you to master more difficult administrative tuning and troubleshooting tasks than you ever thought possible. Topics covered include: The MERITS performance optimization method which extends the state of the art wait event tuning paradigm; Controlling processes of an ORACLE instance with the fragmentarily documented ORADEBUG command to trace SQL statements as well as wait events and dump process state, call stack and hang analysis information; Tracing the cost-based optimizer to understand its cost calculations and decisions; Understanding hidden parameters that govern Automatic PGA Memory Management; Leveraging undocumented features of the Oracle 10g/11g scheduler and other partially or fully undocumented PL/SQL packages such as DBMS_SYSTEM, DBMS_SUPPORT and DBMS_UTILITY. **On the Move to Meaningful Internet Systems: OTM 2013**
