## **Predicting Species Occurrences Issues Of Accuracy And Scale:**

**Predicting Species Occurrences** J. Michael Scott, Patricia Heglund, Michael L. Morrison, 2002-02 Predictions about where different species are where they are not and how they move across a landscape or respond to human activities if timber is harvested for instance or stream flow altered are important aspects of the work of wildlife biologists land managers and the agencies and policymakers that govern natural resources Despite the increased use and importance of model predictions these predictions are seldom tested and have unknown levels of accuracy Predicting Species Occurrences addresses those concerns highlighting for managers and researchers the strengths and weaknesses of current approaches as well as the magnitude of the research required to improve or test predictions of currently used models The book is an outgrowth of an international symposium held in October 1999 that brought together scientists and researchers at the forefront of efforts to process information about species at different spatial and temporal scales It is a comprehensive reference that offers an exhaustive treatment of the subject with 65 chapters by leading experts from around the world that review the history of the theory and practice of modeling and present a standard terminology examine temporal and spatial scales in terms of their influence on patterns and processes of species distribution offer detailed discussions of state of the art modeling tools and descriptions of methods for assessing model accuracy discuss how to predict species presence and abundance present examples of how spatially explicit data on demographics can provide important information for managers An introductory chapter by Michael A Huston examines the ecological context in which predictions of species occurrences are made and a concluding chapter by John A Wiens offers an insightful review and synthesis of the topics examined along with guidance for future directions and cautions regarding misuse of models Other contributors include Michael P Austin Barry R Noon Alan H Fielding Michael Goodchild Brian A Maurer John T Rotenberry Paul Angermeier Pierre R Vernier and more than a hundred others Predicting Species Occurrences offers important new information about many of the topics raised in the seminal volume Wildlife 2000 University of Wisconsin Press 1986 and will be the standard reference on this subject for years to come Its state of the art assessment will play a key role in guiding the continued development and application of tools for making accurate predictions and is an indispensable volume for anyone engaged in species management or conservation

Models for Planning Wildlife Conservation in Large Landscapes Joshua Millsbaugh, Frank R. Thompson, 2011-04-28 A single resource volume of information on the most current and effective techniques of wildlife modeling Models for Planning Wildlife Conservation in Large Landscapes is appropriate for students and researchers alike The unique blend of conceptual methodological and application chapters discusses research applications and concepts of modeling and presents new ideas and strategies for wildlife habitat models used in conservation planning The book makes important contributions to wildlife conservation of animals in several ways 1 it highlights historical and contemporary advancements in the development of wildlife habitat models and their implementation in conservation planning 2 it provides

practical advice for the ecologist conducting such studies and 3 it supplies directions for future research including new strategies for successful studies Intended to provide a recipe for successful development of wildlife habitat models and their implementation in conservation planning the book could be used in studying wildlife habitat models conservation planning and management techniques Additionally it may be a supplemental text in courses dealing with quantitative assessment of wildlife populations Additionally the length of the book would be ideal for graduate student seminar course Using wildlife habitat models in conservation planning is of considerable interest to wildlife biologists With ever tightening budgets for wildlife research and planning activities there is a growing need to use computer methods Use of simulation models represents the single best alternative However it is imperative that these techniques be described in a single source Moreover biologists should be made aware of alternative modeling techniques It is also important that practical guidance be provided to biologists along with a demonstration of utility of these procedures Currently there is little guidance in the wildlife or natural resource planning literature on how best to incorporate wildlife planning activities particularly community based approaches Now is the perfect time for a syntheistic publication that clearly outlines the concepts and available methods and illustrates them Only single resource book of information not only on various wildlife modeling techniques but also with practical guidance on the demonstrated utility of each based on real world conditions Provides concepts methods and applications for wildlife ecologists and others within a GIS context Written by a team of subject area experts

**Representing, Modeling, and Visualizing the Natural Environment** Nick Mount, Gemma Harvey, Paul Aplin, Gary Priestnall, 2008-12-22 The explosion of public interest in the natural environment can to a large extent be attributed to greater public awareness of the impacts of global warming and climate change This has led to increased research interest and funding directed at studies of issues affecting sensitive natural environments Not surprisingly much of this work has re

**Transforming Parks and Protected Areas** Kevin S. Hanna, Douglas A. Clark, D. Scott Slocumbe, 2007-10-18 A rare collection of articles that fuses academic theory critique of practice and practical knowledge Transforming Parks and Protected Areas analyzes and critiques the emerging issues in the design and operation of parks and protected areas

**Improving GIS-based Wildlife-Habitat Analysis** Jeffrey K. Keller, Charles R. Smith, 2014-10-01 Geographic Information Systems GIS provide a powerful tool for the investigation of species habitat relationships and the development of wildlife management and conservation programs However the relative ease of data manipulation and analysis using GIS associated landscape metrics packages and sophisticated statistical tests may sometimes cause investigators to overlook important species habitat functional relationships Additionally underlying assumptions of the study design or technology may have unrecognized consequences This volume examines how initial researcher choices of image resolution scale s of analysis response and explanatory variables and location and area of samples can influence analysis results interpretation predictive capability and study derived management prescriptions Overall most studies in this realm employ relatively low resolution

imagery that allows neither identification nor accurate classification of habitat components. Additionally, the landscape metrics typically employed do not adequately quantify component spatial arrangement associated with species occupation. To address this latter issue, the authors introduce two novel landscape metrics that measure the functional size and location in the landscape of taxon-specific solid and edge habitat types. Keller and Smith conclude that investigators conducting GIS-based analyses of species-habitat relationships should more carefully: 1. match the resolution of remotely sensed imagery to the scale of habitat functional relationships of the focal taxon; 2. identify attributes/explanatory variables of habitat architecture, size, configuration, quality, and context that reflect the way the focal taxon uses the subset of the landscape it occupies; and 3. match the location and scale of habitat samples, whether GIS or ground-based, to corresponding species detection locations and scales of habitat use.

### **Reptile Ecology and Conservation** C. Kenneth Dodd Jr., 2016-05-05

This practical handbook of reptile field ecology and conservation brings together a distinguished international group of reptile researchers to provide a state-of-the-art review of the many new and exciting techniques used to study reptiles. The authors describe ecological sampling techniques and how they are implemented to monitor the conservation status and population trends of snakes, lizards, tuatara, turtles, and crocodilians throughout the world. Emphasis is placed on the extent of statistical inference and the biases associated with different techniques and analyses. The chapters focus on the application of field research and data analysis for achieving an understanding of reptile life history, population dynamics, movement patterns, thermal ecology, conservation status, and the relationship between reptiles and their environment. The book emphasises the need for thorough planning and demonstrates how a multi-dimensional approach incorporates information related to morphology, genetics, molecular biology, epidemiology, statistical modelling, animal welfare, and biosecurity. Although accentuating field sampling, sections on experimental applications in laboratories and zoos, thermal ecology, genetics, landscape ecology, disease, and biosecurity and management options are included. Much of this information is scattered in the scientific literature or not readily available, and the intention is to provide an affordable, comprehensive synthesis for use by graduate students, researchers, and practising conservationists worldwide.
