A variety of theoretical approaches to person environment psychology has been developed over the years representing a rich range of intellectual perspectives. This second edition links the past and present and looks toward the future in reviewing new directions and perspectives in person environment psychology. Stated differently the main thrust of this volume is to present contemporary models and perspectives that make some sensible predictions concerning the individual and the environment using the person environment relationship. Within a person environment framework these models and perspectives are concerned with how people tend to influence environments and how environments reciprocally tend to influence people. Thus this second edition presents new directions in person environment psychology and the implications for theory research and application. *Environmental Psychology* Tony Cassidy, 1997. The first line of articles will center upon cutting edge research showing how interacting with nature can affect health well being and overall improve cognition and affect. Articles in this line will stress in what ways nature can improve psychological functioning and health and also discuss the theories and evidence as to why nature can improve psychological functioning.

For this line we welcome submission of articles that discuss the psychological health and well being benefits from interacting with nature as well as submissions that focus on theoretical considerations and underlying mechanisms that lead to the restorative effects of interacting with nature Given that nature can have a positive impact on psychological functioning and overall health it is also important to understand the variables that facilitate people s recognition of environmental issues that can help foster a more positive attitude towards the preservation of nature This brings us to the second line of articles which will center upon the psychological mechanisms that make individuals more or less likely to accept the seriousness of environmental challenges such as climate change Given the new cutting edge research in this field we may be able to make individuals more proactive in the protection of the environment and more accepting of policy measures required to mitigate climate change We see this research topic as a way for psychological scientists to contribute substantially to an important area of public debate and policy For this line we welcome articles that will focus on ways in which people respond to various framings of policy relevant information and how morality may play into the individuals policy views that center on climate change and environmental protection

*Environmental Psychology* Robert Gifford,1987     *Advances in Environmental Psychology (Volume 5)* Andrew Baum,Jerome E. Singer,2020-09-10 The development of a field or an area of inquiry is often marked by changes in measurement techniques shifts in analytic emphasis and disputes over the best ways of doing research In many areas of psychology a number of issues have characterized methodological evolution of the discipline including questions regarding context and reductionism or laboratory versus field research For some of the newer areas in psychology such as environment or health psychology this is not an issue of either or Although there has been some debate about these trade offs it is generally regarded by people in this field that some combination of the two approaches is essential Depending on the question being studied this balance may change However the questions asked are less likely to inquire which way is better and concentrate on how both may be used This observation serves to illustrate the fact that different research endeavours have different methodological issues Originally published in 1985 this volume explores some of the issues characterizing work on health environment and behavior
