Wireless Sensor Networks. Routing Protocol Overview Madhumathy Perumal, R. Umamaheswari, 2020-11-27

Document from the year 2020 in the subject Engineering Computer Engineering language English abstract. Sensor nodes have restricted storage, computational, and energy resources; these restrictions place a limit on the types of deployable routing mechanisms. Routing protocols disseminate information that enables the sensor nodes to select routes to communicate with other nodes on the network, and the choice of the route is determined by the routing algorithms. Thus, the routing protocol helps the nodes gain knowledge about the topology of the network to which it is attached directly. There are mainly two types of routing processes: one is static routing and the other is dynamic routing. In static routing, the routing tables are set up in a static manner in the nodes. The network routes for the packet are initially set between the nodes. However, if any node on the specified route fails, the data may not reach the destination. In dynamic routing, routing tables in the routers often change whenever the possible routes change. Dynamic routing is more suitable as the nodes in WSNs may frequently change their position and die at any moment. The routing protocols are classified into single-hop and multi-hop routing. In single-hop routing, a sensor node directly communicates with the sink to share the gathered information. Energy consumption is high in the network using single-hop protocol. In multi-hop routing, data is routed through intermediate nodes to the base station. Each node transfers sensed data to the immediate node, which in turn transfers the data to the next immediate node, and finally the data reaches the base station. Energy consumption in this kind of routing protocol is less, and thus the lifetime of the nodes is high. The major challenge to the efficient operation of wireless sensor network lies in its ability to deliver the sensed information from the nodes to the sink within the specific time duration without the loss of data packets. *Wireless Sensor Multimedia Networks* Mohamed Mostafa A. Azim, Xiaohong Jiang, 2015-10-28. Wireless sensor networks (WSNs) are a special class of ad hoc network in which network nodes composed of tiny sensors pass data such as temperature, pressure, and humidity through the network to a central location. Wireless sensor multimedia networks (WSMNs) are a special category of WSNs in which the sensor nodes are small cameras and microphones. **Smart Wireless Sensor**

Networks Mohammed Abdulaziz Almeer, 2014 This dissertation proposes a methodology for performance evaluation and comparison of Wireless Sensor Network WSN protocols The methodology is simulation based and it examines the protocols lifetime scalability fault tolerance and the affect of multiple sinks Both the evaluation and the comparison consider the network lifetime both the number of rounds before the death of the first node and the number of rounds before the death of the last node the energy dissipation rate and the nodes death rate The methodology is conducted on LEACH TEEN APTEEN and REE LEACH protocols The proposed methodology provides a better understanding of the protocols behavior This study emphasizes on some information that helps WSN designers to take decisions Beside which protocol lives longer the designers should consider other details about these protocols Such as the death rate and energy dissipation rate should be considered for redeployment decision Furthermore the designers should consider the affect of enlarging the network not only on the rounds for first or last death but also they should consider the affect on the ratio between the first and last deaths rounds

Moreover there are other findings that help the WSN users and designers to take adopting a protocol decisions Furthermore the analysis conducted in this research proves and supports some of the main attributes of the protocols that are claimed in the literature Such as the equality of percentage between the failing nodes and the lost energy by failure and the affect of multi sink on the death rates prove that the protocols have a good level of load balancing Furthermore the changes in the death rate and energy dissipation rate mean a good level of fault tolerance In general the proposed methodology provides better understanding of the protocols Furthermore it provides abundant amount of information to determine protocol suitability for different WSN applications Moreover this extended analysis reveals drawbacks that should be considered in future works
