Emphasis in agricultural research for many years has concentrated on crop production This emphasis has become more important in recent years with the realization that the population worldwide is outstripping the food supply There is however another side to increasing the availability of the food supply This simply involves preservation of the harvested crop for human consumption The losses incurred in harvesting handling transportation storage and marketing crops have become a greater problem as the distance from the farm to the ultimate consumer increases In the Western world where modern transportation storage facilities and marketing technology are widely used post harvest technology requires a large input of energy which increases costs considerably Therefore losses are more significant and the ability to provide fresh fruits and vegetables out of season at reasonable costs will depend on reduced post harvest losses throughout the marketing chain from the farm gate to the ultimate consumer The reduction in post harvest losses depends on proper use of current technology and further developments derived from a broad spectrum of scientific disciplines Biochemistry plant physiology plant pathology horticulture agronomy physics engineering and agricultural economics all provide knowledge which has been useful and will be useful in the future for improving post harvest technology and crop preservation This volume records the Proceedings of the NATO Advanced Study Institute on Post Harvest Physiology and Crop Preservation held at Sounion Greece April 28 May 8 1981      *Postharvest Physiology and Biochemistry of Fruits and Vegetables* Elhadi M. Yahia,Armando

Carrillo-Lopez,2018-10-31 Postharvest Physiology and Biochemistry of Fruits and Vegetables presents an updated interrelated and sequenced view of the contribution of fruits and vegetables on human health their aspects of plant metabolism physical and chemical compositional changes during the entire fruit development lifecycle the physiological disorders and biochemical effects of modified controlled atmospheres and the biotechnology of horticultural crops The book is written specifically for those interested in preharvest and postharvest crop science and the impact of physiological and biochemical changes on their roles as functional foods Deals with the developmental aspects of the lifecycle in whole fruits Describes issues such as the morphology and anatomy of fruits beginning with the structural organization of the whole plant and explaining the fruit structure and its botanical classification Addresses biotechnological concepts that control firmness quality and the nutritional value of fruits      **Post-harvest Physiology of Food Crops** William Glynn Burton,1982 Deze

**Postharvest Physiology and Storage of Tropical and Subtropical Fruits** S. K. Mitra, 1997 Tropical and subtropical fruits are becoming more important food items in countries where they are produced and also in an increasing number of importing countries in non tropical zones For many of the countries where they are grown these crops represent one of the primary ways of earning valuable foreign exchange In the last few years fruit production in most tropical and subtropical countries of the world has increased substantially and most of the fruits grown in these regions now have established and growing markets in North America and Europe The transport of tropical and subtropical fruits from areas of production to markets in temperate zones raises particular postharvest storage issues while postharvest losses in the tropics themselves can be considerable Whilst there are several texts addressing the postharvest needs of temperate fruits there has not until now been a comprehensive volume dealing with tropical and subtropical fruits This volume is the first book to deal with the postharvest storage physiology and conservation of all of the economically
