Plasticity of monocytes/macrophages: phenotypic changes during disease progression Ruoxi Yuan, Chao Yang, Yanan Ma, Liwu Li, 2023-12-07 Macrophage is a key component of innate immunity that exhibit extensive plasticity and heterogeneity They are present in virtually every organ of the body and can be replenished by circulating monocytes following insults Originally macrophages were divided into two major phenotypes pro inflammatory M1 which is

initiated by TNF INF and bacterial components such as lipopolysaccharide LPS and anti inflammatory M2 which is activated through stimulation of IL 4 IL 10 and IL 13 However segregation into two distinct phenotypes is a marked simplification of the in vivo reality and it is now widely accepted that macrophage phenotype is plastic and determined by highly complex microenvironments and therefore likely more accurately considered as a spectrum of possible forms of activation Numerous studies have documented flexibility in their programming with macrophages switching from one functional phenotype to another in response to the variable microenvironmental signals of the local milieu Various macrophage populations exist that play distinct and non redundant roles in fibrosis tissue repair and regeneration For instance in a general wound healing process embryo derived tissue resident macrophages are rapidly replaced by monocytes after the initial injury These monocyte derived macrophages play an active role in the early initiation of acute inflammation As early as 24 72 h upon tissue injury macrophage function changes toward an anti inflammatory phenotype that promotes cell proliferation and tissue remodeling Upon resolution of inflammation steady state self maintenance of macrophages is also recovered The wound microenvironment has a predominant role in the behavior and functionality of cells Both mouse and human diabetic wound preferably induce persistent proinflammatory macrophage polarization that contributes to chronic non healing wounds Contrastingly prolonged activation of M2 macrophages can also lead to excessive wound healing and ultimately fibrosis In the context of cancer anti inflammatory macrophages have been associated with tumor progression and immunosuppression thereby negatively affecting the prognosis of patients On the other hand studies also showed that the phenotypical changes of macrophages are also accompanied by changes in glycolysis and mitochondrial related genes as well Classically activated proinflammatory M1 macrophages depend to a large extent on glycolysis and produce lactate as the tricarboxylic acid cycle is blocked at two steps Alternatively activated M2 macrophages prefer oxidation and oxidative phosphorylation to synthesize ATP However the number and diversity of signals and the magnitude of the response required to switch macrophages into a pro or anti inflammatory state remain unclear A number of techniques have been developed over the years to identify and visualize cell populations uncover regulatory relationships between genes and track the trajectories of distinct cell lineages in development The identification of mechanisms and molecules associated with macrophage plasticity and polarized activation provides a basis for macrophage centered diagnostic and therapeutic strategies Understanding and being able to controllably promote the desired macrophage phenotypes could have a significant impact on a wide range of diseases

Today's Nutrition and Tomorrow's Public Health: Challenges and Opportunities Irene Lenoir-Wijnkoop, Iñaki Gutiérrez-Ibarluzea, Dominique J. Dubois, 2016-04-29 At the dawn of the third millennium we are confronted with a disturbing phenomenon although global life expectancy still increases this is not the case for healthy life expectancy The explanation of this seemingly contradiction is mainly due to the rising prevalence of the new pandemic of chronic non communicable diseases NCDs Even in low and middle income countries the improvement in healthcare status and life expectancy is paralled

by the increase of NCDs as in all countries worldwide Since the United Nations General Assembly held in New York in 2011 many publications have emphasized the close link between NCDs and nutrition The NCDs epidemic forces us to reconsider the public health perspectives Many governments non governmental organizations and other institutions are actively involved in educational nutrition programs and campaigns however their efforts seldom obtain the results hoped for It is extremely difficult to induce changes in lifestyle and behavior that have built up over a long period of time However it becomes urgent to adapt to our changing life environment where traditional wisdom and intuitive choices are giving way to individual thinking and search for often uncontrolled information This engenders a number of unprecedented challenges and it calls for a re appraisal of the existing paradigms to achieve an adequate management of the upstream determinants of health instead of a pre dominant medical and hospital centric approach In the era of personalized healthcare it is time to empower policy makers professionals and citizens for achieving an evidence based change in the health disease interface and decision making process for public health interventions The scientific and professional society Health Technology Assessment International HTAi has recognized nutrition as a health technology preventative by creating a Interest Group IG dedicated to research on methodologies and assessments of nutrition related public health while taking into account contextual factors ethical legal social organizational economic in order to generate meaningful outcomes for establishing evidence based health policies This Research Topic aims to elaborate on some of the potential hurdles or guarantees which have to be overcome for the sake of sustainable healthcare provisions anywhere in the world such as shortcomings in methodological approaches regulatory frameworks gaps between evidence its hierarchy and final recommendations for public health management
