Powder Materials Current Research And Industrial Practices:

Powder Materials Fernand D. S. Marquis, 2003 Compiling presentations from scientists engineers and manufacturers this book will include papers on powder making powder conditions reactive powder handling powder characterization hot and cold uniaxial pressing hot and cold isostatic pressing powder rolling extrusion sintering heat treatment and processing facilities rapid and directional solidification consolidation in situ synthesis of composites ceramics and intermetallics atmospheric and low pressure plasma spray flame spray wire arc spray alloy and materials development mechanical behavior of bulk powder based materials physical based mathematical models theories simulation micromechanisms and end use products From Materials Science Technology 2003 to be held in Chicago Illinois November 9 12 2003 *Elektrisch leitfähige Füllstoffnetzwerke in Duroplasten auf der Basis von Kohlenstoff-Nanopartikeln, -Nanofasern und -Nanotubes* Matthias-Klaus Schwarz, 2006-07-04 Polymere besitzen in der Regel hohe elektrische Widerstände In vielen Anwendungen wie z B bei Mikrowellengeschirr oder auch Isolatoren für elektronische Bauteile ist das ein Vorteil Laden sich Teile einer polymeren Baugruppe durch Reibung elektrostatisch auf so erweist sich aber gerade diese Eigenschaft als Nachteil Elektrisch leitfähige Bauteile auf Kunststoffbasis lassen sich auf unterschiedlichen Wegen herstellen Bei vielen Polymeren besteht die Möglichkeit sie mit einem leitfähigen Füllstoff zu durchmischen Ziel dieser Arbeit ist es die chemisch physikalischen Wechselwirkungen von Epoxyharzen mit kohlenstoffartigen Füllstoffen soweit zu klären dass sowohl das Perkulationsverhalten der Verbundwerkstoffe als auch das Verhalten der Füllstoff Epoxyharz Dispersionen im elektrischen Feld aus charakteristischen Parametern der Epoxyharze und des Füllstoffes vorhergesagt werden kann Als Füllstoffe kommen einerseits Hochleitfähigkeiten wegen der großen Oberfläche und andererseits Kohlenstoff Nanofasern und Nanotubes als Beispiele für Füllstoffe mit einem hohen Aspektverhältnis zum Einsatz Um die chemische Wechselwirkung Füllstoff Polymer zu charakterisieren wird mit geeigneten Epoxyharzen eine basische Aminsyste me eine neutrale Vinylesterharz und eine saure Anhydridsystem Umgebung in der Dispersion geschaffen Dabei ist es gelungen mit u erst geringen Füllgraden leitfähige Verbundwerkstoffe herzustellen Entsprechend der chemischen Wechselwirkung ändert sich der Füllstoff negativ Aminsyste m basisch positiv Anhydridsystem sauer oder nicht Vinylesterharz neutral auf Geringe ionische Leitfähigkeit Aminsyste me führt zu einer elektrostatisch stabilisierten Dispersion die nur langsam koaguliert Die hohe ionische Leitfähigkeit des Anhydridsystem hat eine rasche Koagulation des Füllstoffes zur Folge Die Perkulationsschwelle ist für den Fall der Aminsyste me stark abhängig von der Probenherstellung Die durch die hohe Oberflächenladung und geringe ionische Leitfähigkeit der Suspension entstandene Potentialbarriere kann durch einen optimierten Herstellungsprozess stark gesenkt werden Durch die Verwendung eines elektrischen Feldes zur Stimulation der Perkolation lassen sich strukturiert leitfähige Netzwerke erzeugen Die im Wechselfeld induzierten Netzwerke sind prinzipiell um ein bis zwei Größenordnungen leitfähiger als die Gleichfeld Netzwerke Ursache hierfür ist die homogenere Struktur der Wechselfeld Netzwerke In Systemen mit hoher

ionischer Leitfähigkeit Anhydridsystem lassen sich nur mit Wechselfeldern leitfähige Netzwerke induzieren Für die ru gefüllten Duroplaste liegen die Leitfähigkeiten der Verbundwerkstoffe bei Feldgraden von 2% im Bereich von 10¹ S/m Mit der Hilfe des elektrischen Wechselfeldes können bei einer Feldstärke von E 100V/cm und 0,5% im Aminsystem Leitfähigkeiten um 10³ S/m erreicht werden Da die Nanofasern in den hier verwendeten Polymeren auf Grund des verwendeten Ausgangsmaterials nicht perkolieren lassen sich nur mit elektrischen Feldern leitfähige Verbundwerkstoffe herstellen Die Elektrophorese der Fasern sowie deren Drehung in Richtung des Feldes ist im Einklang mit theoretischen Aspekten gezeigt worden Bei Verwendung der Nanotubes sind nur sehr geringe Feldgrade zur Herstellung leitfähiger Verbundwerkstoffe erforderlich Erklärt werden kann dies z.T. mit der Hilfe des theoretischen Modells des verdrängten Volumens und unter Verwendung kolloidtheoretischer Aspekte Durch einen optimierten Präparationsprozess reichte ein Feldgrad von 0,0025% CNT aus um im Aminsystem eine Leitfähigkeit von 10⁴ S/m zu erzeugen Die Leitfähigkeit der ohne Feld perkolierten Proben ist höher als die der im Wechselfeld perkolierten Jedoch lassen sich mit der Hilfe elektrischer Felder gezielt strukturierte Netzwerke induzieren die zu einem leitfähigen und optisch transparenten Verbundwerkstoff führen

Sintering: From Empirical Observations to Scientific Principles Randall German, 2014-02-07 As sintering applications march toward a 30 billion global business the models for sintering have progressed but generally follow behind observation Documentation of the steps needed to build to a quantitative and predictive theory are often missed Sintering From Empirical Observations to Scientific Principles partitions sintering applications and observations to show critical turning points required to establish modern sintering as a predictive science This book written by the most cited author in his field is laced with people organizations critical steps and important formulations in a mixture of history personalities and applications Exploring how insights in seemingly unrelated fields sparked progress it is also a teaching tool to show where there is success where there are problems and how to organize teams to leapfrog to new applications or plateaus of use Randall German's Sintering From Empirical Observations to Scientific Principles is a platform for directly addressing the critical control parameters in these new research and development efforts Shows how the theories and understanding of sintering were developed and improved over time and how different products were developed ultimately leading to important knowledge and lessons for solving real sintering problems Covers all the necessary infrastructure of sintering theory and practice such as atomic theory surface energy microstructure and measurement and observation tools Introduces the history and development of such early sintered products as porcelain tungsten lamp filaments bronze bearings steel automotive components platinum crucibles and more
