Prostate Cancer And Bone Metastasis:

Prostate Cancer and Bone Metastasis James P. Karr,Hidetoshi Yamanaka,2012-12-06 The biology of solid tumor metastasis has been the subject of significant scientific and clinical interest for years and while experimental evidence reveals that metastasis is not solely a random event very little is known about the biology of metastasis originating from prostate cancer This is in spite of the fact that the majority of prostate cancer patients die with metastatic lesions to the bone Progress in understanding this most important aspect of prostate cancer has been hampered by the lack of suitable animal models and an inability to accurately quantify bone metastases and their responses to therapy Over the past decade scientists in Japan and the United States have steadily advanced our understanding of the cellular molecular and immunologic biology of primary and disseminated prostate cancer It is this body of new information combined with advances in imaging techniques and prostate cancer tumor markers that prompted the need for an in depth assessment of bone metastasis of prostate cancer Accordingly on December 12 1990 a group of basic and clinical investigators from Japan and the United States convened in Gotenba Japan to hold the first conference devoted solely to the basic biology and clinical aspects of bone metastases originating from prostate cancer The cross fertilization of ideas that was fostered through in depth discussion of technological advances among various basic and clinical disciplines not only further advanced our understanding of prostate metastases to the bone but suggested approaches for precise quantitative assessment of these lesions and their treatment

Bone Metastasis and Molecular Mechanisms Gurmit Singh, William Orr, 2013-11-11 Patients with advanced breast or prostate cancers usually develop bone metastases The principal complications resulting from metastatic bone disease are pain spinal cord compression pathologic fractures and bone marrow suppression Improving the management of bone metastases is crucial to quality of life for patients with breast and prostate cancer Advances in understanding of the molecular mechanisms underlying the pathophysiology of bone metastasis are driving the development of new therapeutic strategies

The Intimate Interplay Between Prostate Cancer and Bone Shahrzad Rafiei, 2015 Prostate cancer is one of the most prevalent forms of cancer and the fifth leading cause of cancer related death among men worldwide The morbidity and mortality associated with the prostate cancer can often be attributed to the consequences of the metastatic spread of cancer cells to distant organs most commonly the bones Once metastasis has occurred therapeutic options are only modestly effective Despite the intensive research efforts in understanding the molecular biology of prostate cancer skeletal metastasis this complex disease remains incurable The studies presented in this thesis seek to clarify the specific mechanism by which tumor cells are retained within the bone and to reveal the specific biochemical factors that facilitate the development of bone metastasis Bone metastasis starts with the tropism of cancer cells to the bone through a specific directional migration induced by the bone signaling factors such as the receptor activator of nuclear factor kappa B ligand RANKL through interaction with cancer cells expressing signaling receptor RANK Whereas osteoprotegerin OPG that also is produced in the bone microenvironment is a soluble decoy receptor for RANKL and prevents RANK RANKL interaction Intriguingly the elevated level of serum OPG in patients with advanced prostate cancer exhibit significant positive correlation with the severity of bone metastasis and poor prognosis However the mechanism of action of OPG produced by metastatic prostate cancer cells is not well understood The first study presented in this thesis provides a tumor promoting function of OPG produced by metastatic cancer cells in contrast to the well known anti resorptive function of bone derived OPG Using OPG knockdown and overexpression strategies I have demonstrated that tumor derived OPG augments RANKL induced directional cell migration likely by the local reduction in RANKL levels and thus increasing the response to RANKL gradient After prostate cancer cells reach the bone to survive in the bone microenvironment these aggressive cells form intimate interaction with the resident bone cells A large body of evidence indicates that beside osteoclastogenic cytokine RANKL additional factors produced by cancer cells act to promote osteoclast formation and are implicated in bone metastasis However the precise molecular mechanism underlying the ability of prostate cancer cells to modulate osteoclastogenesis remains poorly understood In the second study I have demonstrated that in the absence of RANKL tumor derived factors significantly increase the viability of the naive monocytes and induce osteoclastogenesis directly from the late precursors independent

from RANKL Using inhibition studies I have further identified two prominent signaling components induced by these factors in osteoclast precursors a prolonged activation of extracellular signal regulated kinase ERK and a calcium dependent nuclear translocation of nuclear factor of activated T cell cytoplasmic 1 NFATc1 Ultimately identifying the molecular mediators of prostate cancer bone metastasis is the most important goal with respect to the development of successful therapies The third study described in this thesis introduces peroxiredoxin4 PRDX4 as a novel tumor derived factor that is important for inducing osteoclastogenesis Using RNA interference strategies I have demonstrated that diminished PRDX4 secretion from prostate cancer cells significantly decrease the ability of cancer cells to induce osteoclast formation from late precursors Furthermore tibial injections of PRDX4 deficient prostate cancer cells lead to the development of significantly smaller osteolytic lesions compared to control prostate cancer cells Taken together these studies recognize several novel mediators including OPG ERK and PRDX4 which can be used as prognostic markers as well as therapeutic targets for the prevention of prostate cancer bone metastasis

The Role of the Bone Microenvironment in Prostate Cancer Bone Metastasis John C.

O'Connor,2007 The bone environment is particularly susceptible to metastases of certain types of cancer Prostate cancer is unique in that metastases disrupt normal bone homeostasis and almost exclusively result in osteoblastic osteosclerotic bone lesions While the mechanism s behind the preferential metastasis of prostate cancer to bone and the resulting phenotype is poorly understood it is clear that a dynamic environment exists whereby there is an inter play between the prostate cancer cells and the bone stroma that modulates the growth of prostate cancer cells within the bone microenvironment Factors present within the bone environment whether insoluble components of the ECM growth factors cytokines secreted by host cells or direct cell to cell interactions are believed to be at least partially responsible for the preferential growth of metastasis of prostate cancer cells in the bone The studies presented here were undertaken to 1 investigate the role of the surface mucin MUC1 in prostate cancer and 2 investigate the role the bone marrow stromal cells play in the growth of prostate cancer cells in the bone microenvironment I found that MUC1 expression is heterogeneous in both normal and malignant human prostate epithelia and is not likely to be a reliable indicator of prostate cancer grade or progression New data show that ribozyme mediated attenuation of the heparan sulfate proteoglycan perlecan from the bone marrow stromal cell lines HS 5 and HS 27a disrupts growth factor signaling leading to increased apoptosis and altered growth of the bone marrow stromal cells Based on other results from this laboratory it is hypothesized that perlecan attenuation also will alter prostate cancer growth thus providing a possible therapeutic target for treating prostate cancer bone metastases In experiments designed to replicate early events that occur when prostate cancer cells first arrive in the bone microenvironment co culture of prostate cancer cells and HS 5 or HS 27a cells decreased endoglin expression in the bone marrow stromal cells that was caused by a soluble factor s released from DU 145 C4 2 and C4 2B prostate cancer cells but not by foreskin fibroblasts PC 3 ZR 75 1 or LNCaP cells Secondary to the attenuated endoglin expression signaling via both the ALK5 induced Smad2 3 and ALK1

induced Smad1 5 8 signaling pathways was altered subsequently decreasing cell proliferation of the bone stroma Based on the data presented in this dissertation and previously published data early events within the bone microenvironment upon prostate cancer cell arrival involve reciprocal interactions whereby the bone marrow stromal cells try to prevent the establishment of prostate cancer cells within bone and the prostate cancer cells try to alter the host environment to permit their growth in bone Perlecan and endoglin represent two factors expressed by bone marrow stromal cells whose modulation may support prostate cancer cell growth in the bone compartment Potential therapeutic targets for treating prostate cancer bone metastases may emerge from further study of the relevant pathways associated with each molecule

Molecular Medicine Marschall S. Runge, Cam Patterson, 2007-11-18 The concept of molecular medicine dates back to Linus means that there are many new opportunities and challenges Pauling who in the late 1940s and early 1950s generalized for clinical medicine One of the effects of the completion of from the ideas that came from the study of the sickle cell the Human Genome Project is the increasing application of hemoglobin molecule With the first cloning of human genes the fields of molecular biology and genetics to the und about 1976 molecular genetics took the molecular perspec standing and management of common diseases Assimi tive on disease to the level of DNA The term molecular tion of the new developments since the first edition has been medicine achieved wide currency in the 1980s with the ably accomplished by Drs Runge and Patterson with the assignment of this designation to journals at least one soci help of their many knowledgeable authors ety institutes and academic divisions of departments of in As was evident in the first edition molecular genetics is ternal medicine Undoubtedly molecular medicine has been involved in every specialty of medicine A recurrent theme abetted by the Human Genome Project which has aided in that edition perhaps even more striking in the present one greatly in the molecular characterization of disease *Textbook of Bone Metastases* Claude Jasmin, Rodolfo

Capanna, Lawrence Coia, Robert Coleman, Gerard Saillant, 2005-09-27 The epidemiological and clinical importance of bone metastases has long been recognised For example the incidence of bone metastases in breast and prostate cancers is 70% whereas it is only 30 to 40% in metastatic lung cancer In clinical terms bone metastases have substantial negative effects on the patient s quality of life Bone metastases have generally received insufficient attention because of the difficulty in quantifying them which has left them outside the scope of therapeutic trials This textbook is the result of the remarkable progress made in the understanding of the molecular and cellular mechanisms involved in osteogenesis and osteolysis and their development for therapeutic purposes The treatment of malignant hypercalcaemia has also been revolutionised by the use of bisphosphonates The Textbook of Bone Metastases presents a broad approach to recent progress in all fields related to bone metastases ranging from epidemiology to the physiopathology of bone metastases and therapeutics It provides a better understanding of recent advances and more importantly will give clinicians all the information needed to help them in the clinical and therapeutic management of patients with bone metastases
