Modelling and Simulation of Sheet Metal Forming Processes Marta Oliveira, José Valdemar

Fernandes, 2020 The numerical simulation of sheet metal forming processes has become an indispensable tool for the design of components and their forming processes This role was attained due to the huge impact in reducing time to market and the cost of developing new components in industries ranging from automotive to packing as well as enabling an improved understanding of the deformation mechanisms and their interaction with process parameters Despite being a consolidated tool its potential for application continues to be discovered with the continuous need to simulate more complex processes including the integration of the various processes involved in the production of a sheet metal component and the analysis of in service behavior The quest for more robust and sustainable processes has also changed its deterministic character into stochastic to be able to consider the scatter in mechanical properties induced by previous manufacturing processes Faced with these challenges this Special Issue presents scientific advances in the development of numerical tools that improve the prediction results for conventional forming process enable the development of new forming processes or contribute to the integration of several manufacturing processes highlighting the growing multidisciplinary characteristic of this field

Modelling and Simulation of Sheet Metal Forming Processes Marta C. Oliveira, José Valdemar Fernandes, 2020-04-22 The numerical simulation of sheet metal forming processes has become an indispensable tool for the design of components and their forming processes This role was attained due to the huge impact in reducing time to market and the cost of developing new components in industries ranging from automotive to packing as well as enabling an improved understanding of the

deformation mechanisms and their interaction with process parameters. Despite being a consolidated tool its potential for application continues to be discovered with the continuous need to simulate more complex processes including the integration of the various processes involved in the production of a sheet metal component and the analysis of in service behavior. The quest for more robust and sustainable processes has also changed its deterministic character into stochastic to be able to consider the scatter in mechanical properties induced by previous manufacturing processes. Faced with these challenges this Special Issue presents scientific advances in the development of numerical tools that improve the prediction results for conventional forming processes, enable the development of new forming processes or contribute to the integration of several manufacturing processes, highlighting the growing multidisciplinary characteristic of this field. **Sheet Metal**

Forming Processes Dorel Banabic, 2010-06-21. The concept of virtual manufacturing has been developed in order to increase the industrial performances being one of the most efficient ways of reducing the manufacturing times and improving the quality of the products. Numerical simulation of metal forming processes as a component of the virtual manufacturing process has a very important contribution to the reduction of the lead time. The finite element method is currently the most widely used numerical procedure for simulating sheet metal forming processes. The accuracy of the simulation programs used in industry is influenced by the constitutive models and the forming limit curves models incorporated in their structure. From the above discussion we can distinguish a very strong connection between virtual manufacturing as a general concept, finite element method as a numerical analysis instrument and constitutive laws as well as forming limit curves as a specificity of the sheet metal forming processes. Consequently the material modeling is strategic when models of reality have to be built. The book gives a synthetic presentation of the research performed in the field of sheet metal forming simulation during more than 20 years by the members of three international teams: the Research Centre on Sheet Metal Forming CERTETA, Technical University of Cluj Napoca, Romania; AutoForm Company from Zurich, Switzerland; and VOLVO automotive company from Sweden. The first chapter presents an overview of different Finite Element (FE) formulations used for sheet metal forming simulation now and in the past. **Die Design Methodology for Pulsed Sheet Metal Forming Processes**, 2016.

In high speed sheet metal forming processes impact is concentrated over a small contact area and the resulting contact stress can compromise the structural integrity of the die. It is important to accurately predict the associated workpiece/tooling interface loads so that engineers can more confidently propose robust die designs. The foundation for accurate predictions of contact stress on die is a reliable contact model within the context of a finite element simulation. In the literature however there exists no comprehensive guideline for establishing a contact model for high speed sheet metal forming processes using the finite element method. In this work a mathematically justified contact model and modeling recommendations are offered for the electrohydraulic forming process. The model will focus on aspects such as contact algorithm, mesh size and time step size that are known to play essential roles in providing accurate results in modelling of such high speed processes. **Metal**
