## **Protein Targeting Protocols:**

*Protein Targeting Protocols* Roger A. Clegg, 2008-02-04 It is by no means a revelation that proteins are not uniformly distributed throughout the cell. As a result, the idea that protein molecules, because of the specificity with which they can engage in interactions with other proteins, may be aimed via these interactions at a restricted target is a fundamental one in contemporary molecular life sciences. The target may be variously conceived as a specific molecule, a group of molecules, a structure, or a more generic type of intracellular environment. Because the concept of protein targeting is intuitive rather than explicitly defined, it has been variously used by different groups of researchers in cell biology, biochemistry, and molecular biology. For those working in the field of intracellular signaling, an influential introduction to the topic was the seminal article by Hubbard and Cohen, *TIBS* 1993, 18, 172-177, which was based on the work of Cohen's laboratory on protein phosphatases. Subsequently, the ideas that they discussed have been further developed and extended by many workers to other key intermediaries in intracellular signaling, including protein kinases and a great variety of modulator and adaptor proteins.

**Protein Targeting Protocols** Roger A. Clegg, 1998-01-14 Master experimentalists describe largely from the perspective of intracellular signaling their best methods for detecting and analyzing the proteins and protein motifs involved in targeting interactions. The techniques range from basic methods that reveal the existence of targeting interactions and characterize physicochemical properties to those for analyzing the more structurally elaborate systems involved in the movement of molecules between cellular compartments, with examples taken from nuclear transport, clathrin-coated vesicle traffic, and secretory sorting. The themes of targeting domains, particularly the SH2, SH3, and PH domains, and the principal targeting of lipid modifications, myristoylation, reversible palmitoylation, and prenylation, are fully explored. This book will serve well as a firm methodological foundation for laboratories newly entering this field and as an indispensable reference work for those already well established in it.

**Protein Targeting** Anthony Pabsley, 1989-06-28 Protein Targeting reviews different aspects of protein targeting, including similarities and differences in the pathways involved. The early stages of protein export and secretion in prokaryotes and eukaryotes are examined, along with the targeting of mitochondrial and chloroplast proteins, as well as some important differences in the biogenesis of the two organelles. Comprised of nine chapters, this book begins with an overview of terminology and basic principles of protein targeting, focusing on protein traffic in eukaryotic and bacterial cells. The reader is then introduced to the basic principles and techniques of protein targeting, including protein identification and posttranslational modification. Subsequent chapters deal with the early stages in the secretory pathway, later stages in the prokaryotic and eukaryotic secretory pathways, targeting of mitochondrial, chloroplast, and peroxisomal proteins, and targeting of nuclear proteins. The book also discusses endocytosis, before concluding with a description of applications of protein targeting. This monograph will be of value to scientists and biotechnologists, as well as to students of cell biology, biochemistry, microbiology, and molecular biology.
