Shallow Soil:

Management of Soil Problems Khan Towhid Osman, 2018-05-03 Soils are neither good nor bad but some have inherent or acquired characteristics that may or may not suit our intended use Unsuitable characteristics are considered to be soil problems soil constraints or soil limitations Only twelve percent of global land is right for agricultural production without much limitation Some soils have severe limitations for crop production These soils are so called problem soils Many of them do not have enough fertility to be productive some are arid and saline some are very sandy and dry and some are wet and waterlogged for most of the growing season The global demand for food wood fuel fiber medicine and other plant products for the 7.2 billion current world population has created such an immense pressure on global soil resources that even the most fertile soils are losing their productive capacity We are being compelled to bring more and more unsuitable or marginally suitable soils under cultivation Unless innovative and integrated soil crop and environmental management practices are adopted for their improvement and sustainable use further degradation is inevitable This book *Management of Soil Problems* identifies the problems and discusses management options in a smooth and reader friendly style It will be useful for students and professionals of soil science agriculture forestry geography and environmental sciences **Right Plant, Right Place**

Livestock Grazing Harald Plachter, Ulrich Hampicke, 2010-02-02 One of the main objectives of nature conservation in Europe is to protect valuable cultural landscapes characterized by a mixture of open habitats and hedges trees and patchy woodland semi open landscapes The development of these landscapes during the past decades has been characterized by an ongoing intensification of land use on the one hand and an increasing number of former meadows and pastures becoming fallow as a result of changing economic conditions on the other hand Since species adapted to open and semi open landscapes contribute to biodiversity in Europe in a major way this development is of great concern to nature conservation In several countries largescale nature adapted pastoral systems have been recognized as one solution to this problem These systems could offer an alternative to industrial livestock raising and keep a high biodiversity on the landscape level Against the background of livestock diseases such as BSE and Foot and Mouth Disease and the efforts to reform the Common Agricultural Policy in the EU by changing the criteria for agricultural subsidies these concepts gain particular significance They could also represent an alternative to the established costly habitat management tools **Dominion Experimental**
