Brain-Compatible Mathematics Diane Ronis,2007 Recharge your math instruction with brain friendly teaching units Students brains are wired to make them natural curious learners The mathematical world around them offers a vast classroom filled with shapes spaces quantities and experiences to discover and explore all leading to the construction of understanding Teachers can use this natural curiosity to tap the inborn neural mechanisms that motivate students to learn to make relevance and meaning of their surroundings Brain Compatible Mathematics Second Edition bridges the findings from the realms of brain research and improved mathematics instruction through updated teaching samples connections to the most recent standards newest research findings and integration to other content areas Each brain is different and when teachers teach problem solving skills to help students arrive at their own solution paths students go beyond mere memorization of facts and algorithms to being an actual participant in the development of mathematical understanding In an informative and relevant approach Diane Ronis presents teachers and math leaders with an emphasis on thinking mathematical representation and construction of ideas and an abundance of Sample lessons units and strategies linked to 2000 NCTM standards Brain friendly strategies for math teaching that meet NCLB requirements How to guides for creating more brain tuned math teaching Ideas for incorporating technology into the math curriculum Planning templates for immediate use By integrating math learning into real world applications students can actively practice what they learn make meaning out of their everyday experiences and think mathematically for success within today s information age

Artificial Intelligence in Design '98 John S. Gero,Fay Sudweeks,2012-12-06 The development of computational models of design founded on the artificial intelligenceparadigm has provided an impetus for

much of current design research. As artificial intelligence has matured and developed new approaches so the impact of these new approaches on design research has been felt. This can be seen in the way concepts from cognitive science have found their way into artificial intelligence and hence into design research. And also in the way in which agent based systems are being incorporated into design systems. In design research there is an increasing blurring between notions drawn from artificial intelligence and those drawn from cognitive science. Whereas a number of years ago the focus was largely on applying artificial intelligence to designing as an activity thus treating designing as a form of problem solving today we are seeing a much wider variety of conceptions of the role of artificial intelligence in helping to model and comprehend designing as a process. Thus we see papers in this volume which have as their focus the development or implementation of frameworks for artificial intelligence in design attempting to determine a unique locus for these ideas. We see papers which attempt to find foundations for the development of tools based on the artificial intelligence paradigm often the foundations come from cognitive studies of human designers.

Management of Standard Graphic Symbols in a Computer-aided Design and Drafting Environment Using Neural Network Approaches Der-Shung Yang, 1994 Abstract Computer Aided Design and Drafting CADD systems have become prevalent for producing building design drawings. An ultimate goal of CADD systems is to automate analyses and communication of high level design information extracted from CADD drawings a difficult task because of the lack of CADD standards. Using standard graphic symbols attached with symbolic information can help but locating symbols in large libraries is difficult. AUGURS is a new interactive tool designed to assist CADD users in utilizing standard symbols. The task of recognizing symbols sketched by CADD users differs from traditional pattern recognition problems in several ways. Standard libraries have over 1000 symbols grouped into seven disciplines. The large symbol set makes training data difficult to obtain. Since AUGURS is embedded in the CADD system it must be efficient and compact. Also it needs to handle irregular distortion in symbols sketched by users. These difficulties are lessened by the special output format that requires AUGURS to perform only admissible recognition classifying the input to a small set of plausible symbols. The symbol recognition program in AUGURS is a neural network similar to the Neocognitron but is more compact and efficient and having better recognition performance. The main thrust of the AUGURS approach is a novel network structure encoded with general knowledge balancing the discriminant power and the noise tolerance of the network. To handle large symbol sets another thrust of the AUGURS approach is to construct a network by first building an integrated network from the internal structures of smaller networks trained on sub tasks and then pruning unnecessary components from this integrated network. This research contains an extensive empirical study of numerous related work varying conditions and parameters. The results demonstrate the superiority of the AUGURS approach over many alternatives including Zipcode Nets an unconstrained network networks using such invariant features as Zernike moments pseudo Zernike moments normalized moments and Fourier Mellin descriptors the Integrated Neural Network and the connectionist gluing approach. A practicality

analysis shows that AUGURS can handle around 100 symbols about the size of a discipline library To enable AUGURS to handle even more symbols future work is planned to augment it with domain specific knowledge and other improvements
