Problem Of The Earths Shape From Newton To Clairaut:

The Problem of the Earth's Shape from Newton to Clairaut John L. Greenberg, 1995-07-28 This book investigates through the problem of the earth's shape part of the development of post Newtonian mechanics by the Parisian scientific community during the first half of the eighteenth century In the Principia Newton first raised the question of the earth's shape John Greenberg shows how continental scholars outside France influenced efforts in Paris to solve the problem and he also demonstrates that Parisian scholars including Bouguer and Fontaine did work that Alexis Claude Clairaut used in developing his mature theory of the earth's shape The evolution of Parisian mechanics proved not to be the replacement of a Cartesian paradigm by a Newtonian one a replacement that might be expected from Thomas Kuhn's formulations about scientific revolutions but a complex process instead involving many areas of research and contributions of different kinds from the entire scientific world Greenberg both explores the myriad of technical problems that underlie the historical development of part of post Newtonian mechanics which have only been rarely analyzed by Western scholars and embeds his technical discussion in a framework that involves social and institutional history politics and biography Instead of focusing exclusively on the historiographical problem Greenberg shows as well that international scientific communication was as much a vital part of the scientific progress of individual nations during the first half of the eighteenth century as it is today

The Problem of the Earth's Shape from Newton to Clairaut John L. Greenberg, 1995 **The Problem of the Earth's Shape from Newton to Clairaut** John L. Greenberg, 1995 **The Life and Work of James Bradley** John Fisher, 2024-03-08 James Bradley once the most celebrated astronomer in Europe is now an obscure figure surprising given that he was the first to establish empirically that the Earth was a planet in motion around the Sun Introduced to the science of positional astronomy by his uncle James Pound he excelled in his abilities to make precise observations Mentored by Edmond Halley he observed Jupiter and its satellites identifying the gravitational resonances of the three innermost Galilean satellites before being proposed to the fellowship of the Royal Society by Halley with the approval of Newton Elected to the Savilian Chair in Astronomy at Oxford he joined Samuel Molyneux and George Graham in the attempt to observe annual parallax at Kew based on the attempt of Robert Hooke This experiment revealed a counter intuitive motion of the object star that defied all attempts at the resolution of the problem He designed a research programme at Wanstead when he studied the motions of 70 stars identifying a new discovered motion later called the aberration of light Recognising another motion within the residuals of his observations he identified it as a nutation of the Earth's axis He taught experimental philosophy at Oxford for 31 years His final work as Astronomer Royal was a stellar survey of unprecedented dependability taking note of every possible cause of error later reduced by Friedrich Wilhelm Bessel in his *Fundamenta Astronomi* producing a stellar catalogue of 3 222 stars [Dynamics of the Earth](#) V. I. Ferronsky, S.V. Ferronsky, 2010-06-28 In their search for solutions to problems concerning the dynamics of the Earth as a self gravitating body the authors have applied the fundamentals found in

their book *Jacobi Dynamics* 1987 Reidel First satellite observations have shown that the Earth does not remain in hydrostatic equilibrium which forms the physical basis of modern geodynamics Secondly satellite data have established a relationship between the planet's polar moment of inertia and the potential of the Earth's outer force field which proves the most basic point of Jacobi dynamics This allowed the authors to revise their derivation of the classical virial theorem introducing the concept of a volumetric force and volumetric moment and so to obtain a generalized virial theorem in the form of Jacobi's equation The main dynamical effects are the kinetic energy of oscillation of the interacting particles which explains the physical meaning and nature of gravitational forces separation of shells of a self gravitating body with respect to its mass density differences in angular velocities of the shell's rotation continuity in variance of the potential of the outer gravitational force field together with reductions in the envelope of the interacting masses volumetric center of gravity the nature of Earth Moon and satellite precession the nature and generating mechanism of the planet's electromagnetic field the common nature of gravitational and electromagnetic energy and other related issues The work is a logical continuation of the book *Jacobi Dynamics* and is intended for researchers teachers and students engaged in theoretical and experimental research in various branches of astronomy geophysics planetology and cosmogony and for students of celestial statistical quantum and relativistic mechanics and hydrodynamics

Formation of the Solar System V.I. Ferronsky, S.V. Ferronsky, 2013-02-11 Analysis of the orbital motion of the Earth the Moon and other planets and their satellites led to the discovery that all bodies in the Solar System are moving with the first cosmic velocity of their proto parents The mean orbital velocity of each planet is equal to the first cosmic velocity of the Protosun the radius of which is equal to the semi major axis of the planet's orbit The same applies for the planets satellites All the small planets comets other bodies and the Sun itself follow this law a finding that has also been proven by astronomical observations The theoretical solutions based on the Jacobi dynamics explain the process of the system creation and decay as well as the nature of Kepler's laws Pierre Louis Moreau de Maupertuis Hartmut Hecht, 1999 *Die Philosophie des 18. Sciences of the Earth Gregory A. Good, 2019-10-18 The planet as seen by its inhabitants In two millennia our knowledge of the planet and its natural laws and forces has undergone remarkable changes from the religious belief of earth as the center of the universe to the modern astronomer's view that it is a mere speck in the cosmos Now a first of its kind reference work charts this remarkable intellectual progression in our evolving perception of the earth by surveying the history of geology geography geophysics oceanography meteorology space science and many other fields Covers human understanding of the Earth in various times and cultures The Encyclopedia traces our understanding of the earth and its functioning throughout history summarizing historical explanations of earthly occurrences including explanations with no scientific basis It presents the latest facts and theories explains how our understanding of the earth has evolved and shows why many outrageous and fanciful earlier ideas were accepted in their time The coverage explores the physical phenomena that inform our knowledge starting at the earth's core and extending outward through the mantle crust oceans and atmosphere to the magnetosphere and beyond Charts the evolution of our perceptions The primary focus of the Encyclopedia is the history of the study of the earth It also discusses the institutions that advanced and shaped science and probes the interplay between science practical applications and social and political forces The result is a unified historical overview of the earth across a wide canvas of time and place from antiquity to the space age Its wide-ranging articles summarize subjects as diverse as geography and imperialism environmentalism computers and meteorology ozone formation theories since 1800 scientific rocketry the Scopes trial and much more Special Features Shows how diverse disciplines from geology to space science fit together in a coherent view of the earth Explains earlier ideas and theories in the context of the beliefs and scientific knowledge of their time Spotlights important institutions that have shaped the history of science Explores relationships between science practical applications and sociopolitical concerns Provides a subject index and an index of scientists with birth death dates

The Earth Sciences in the Enlightenment Kenneth L. Taylor, 2008 This volume is concerned with the geological sciences in the 18th century with special emphasis on France and French scientists One focus is on the pioneering geologist Nicolas Desmarest whose investigations in Auvergne and Italy among other places had important consequences in both theory and practice Widening his inquiry beyond Desmarest Professor Taylor also endeavors to recover key elements of the presuppositions and thought patterns of Enlightenment geologists and to discern how

geological investigation worked during this formative period Many of the participants are seen as struggling to define their scientific objectives and procedures by drawing from the competing frameworks of physique or natural philosophy descriptive natural history and antiquarian scholarship or developmental history **Proceedings of the Regents** Smithsonian Institution,1891 Annual Report of the Board of Regents of the Smithsonian Institution Smithsonian Institution.
