PHEV-EV Charger Technology Assessment with an Emphasis on V2G Operation, 2012 More battery powered electric vehicles EVs and plug in hybrid electric vehicles PHEVs will be introduced to the market in 2011 and beyond Since these vehicles have large batteries that need to be charged from an external power source or directly from the grid their batteries charging circuits charging stations infrastructures and grid interconnection issues are garnering more attention This report

summarizes information regarding the batteries used in PHEVs different types of chargers charging standards and circuits and compares different topologies Furthermore it includes a list of vehicles that are going to be in the market soon with information on their charging and energy storage equipment A summary of different standards governing charging circuits and charging stations concludes the report There are several battery types that are available for PHEVs however the most popular ones have nickel metal hydride NiMH and lithium ion Li ion chemistries The former one is being used in current hybrid electric vehicles HEVs but the latter will be used in most of the PHEVs and EVs due to higher energy densities and higher efficiencies The chargers can be classified based on the circuit topologies dedicated or integrated location of the charger either on or off the vehicle connection conductive inductive wireless and mechanical electrical waveform direct current dc or alternating current ac and the direction of power flow unidirectional or bidirectional The first PHEVs typically will have dedicated on board unidirectional chargers that will have conductive connections to the charging stations or wall outlets and will be charged using either dc or ac In the near future bidirectional chargers might also be used in these vehicles once the benefits of practical vehicle to grid applications are realized The terms charger and charging station cause terminology confusion To prevent misunderstandings a more descriptive term of electric vehicle supply equipment EVSE is used instead of charging station The charger is the power conversion equipment that connects the battery to the grid or another power source while EVSE refers to external equipment between the grid or other power source and the vehicle EVSE might include conductors connectors attachment plugs microprocessors energy measurement devices transformers etc Presently there are more than 40 companies that are producing EVSEs There are several standards and codes regarding conductive and inductive chargers and EVSEs from the Society of Automotive Engineers SAE the Underwriter Laboratories UL the International Electrotechnical Commission IEC and the National Electric Code NEC The two main standards from SAE describe the requirements for conductive and inductive coupled chargers and the charging levels For inductive coupled charging three levels are specified Level 1 120 V and 12 A single phase Level 2 208 V 240 V and 32 A single phase and Level 3 208 600 V and 400 A three phase The standard for the conductive coupled charger also has similar charging ratings for Levels 1 and 2 but it allows higher current ratings for Level 2 charging up to 80 A Level 3 charging for this standard is still under development and considers dc charging instead of three phase ac More details in these areas and related references can be found in this Oak Ridge National Laboratory ORNL report on PHEV EV charger technology assessment
