

VII. CONCLUSION

In this paper, the different gates were analyzed and designed. These gates exhibit the behavior of the controlled NOT gate and the multiplexer. This is further implemented in the design of a four bit barrel shifter which shifts incoming data and produces random output. The Barrel shifter designed works on the basis of Multiple valued logic in which the inputs and the outputs are multiple values . Thus all these designs are designed and the outputs are successfully verified using Modelsim simulator. In future, the comparison between normal barrel shifter and the newly designed MVL barrel shifter in terms of reducing power, delay and area will be shown.
