Algorithms and Computation D. T. Lee,2000 This book constitutes the refereed proceedings of the 11th International Conference on Algorithms and Computation ISAAC 2000 held in Taipei Taiwan in December 2000 The 46 revised papers presented together with an invited paper were carefully reviewed and selected from 87 submissions The papers are organized in topical sections on algorithms and data structures combinatorial optimization approximation and randomized algorithms graph drawing and graph algorithms automata cryptography and complexity theory parallel and distributed algorithms computational geometry and computational biology **Limits to Parallel Computation** Raymond Greenlaw,H. James Hoover,Walter L. Ruzzo,1995 This book provides a comprehensive analysis of the most important topics in parallel computation It is written so that it may be used as a self study guide to the field and researchers in parallel computing will find it a useful reference for many years to come The first half of the book consists of an introduction to many fundamental issues in parallel computing The second half provides lists of P complete and open problems These lists will have lasting value to researchers in both industry and academia The lists of problems with their corresponding remarks the thorough index and the hundreds of references add to the exceptional value of this resource While the exciting field of parallel computation continues to expand rapidly this book serves as a guide to research done through 1994 and also describes the fundamental concepts that new workers will need to know in coming years It is intended for anyone interested in parallel computing including senior level undergraduate students graduate students faculty and people in industry As an essential reference the book will be needed in all academic libraries **Object Management in Distributed Database Systems for Stationary and Mobile Computing Environments** Wujuan Lin,Bharadwaj Veeravalli,2013-11-21 N etwork based computing domain unifies all best research efforts presented from single computer systems to networked systems to render overwhelming computational power for several modern day applications Although this power is expected to grow with respect to time due to tech nological advancements application requirements impose a continuous thrust on network utilization and on the resources to deliver supreme quality of service Strictly speaking network based computing dornain has no confined scope and each element offers considerable challenges Any modern day networked application strongly thrives on efficient data storage and management system which is essentially a Database System There have been nurnber of books to date in this domain that discuss fundamental principles of designing a database systern Research in this dornain is now far matured and rnany researchers are venturing in this dornain continuously due to a wide variety of challenges posed In this book our dornain of interest is in exposing the underlying key challenges in designing algorithms to handle unpredictable requests that arrive at a Distributed Database System DDBS and evaluating their performance These requests are otherwise called as on line requests arriving at a system to process Transactions in an on line Banking service Airline Reservation systern Video on Demand systern etc are few examples of on line requests **Proceedings of the 34th Annual ACM**
