the twentieth century a new branch of materials science had come into being crystalline materials research Its appearance is

linked to the emergence of advanced technologies primarily based on single crystals bulk crystals and films At the turn of the

last century the impending onset of the ceramic era was forecasted It was believed that ceramics would play a role

comparable to that of the Stone or Bronze Ages in the history of civilization Naturally such an assumption was hypothetical

but it showed that ceramic materials had evoked keen interest among researchers Although sapphire traditionally has been

considered a gem it has developed into a material typical of the ceramic era Widening the field of sapphire application

necessitated essential improvement of its homogeneity and working characteristics and extension of the range of sapphire

products especially those with stipulated properties including a preset structural defect distribution In the early 1980s

successful attainment of crystals with predetermined characteristics was attributed to proper choice of the growth method At

present in view of the fact that the requirements for crystalline products have become more stringent such an approach tends

to be insufficient It is clear that one must take into account the physical chemical processes that take place during the

formation of the real crystal structure i.e the growth mechanisms and the nature and causes of crystal imperfections
