Introduction & Aims

Medical simulation is an important technique to provide education as well as clinical evaluation with physical examination. Simulation is now regarded as a strategy to improve safety of learning (to patient and student) and quality in real medical practice. The aim of this study was to evaluate students' confidence levels in detection of heart and respiratory murmurs with Harvey the Cardiopulmonary Patient Simulator compared to real patients with cardiopulmonary disorders.

Methods

Three hundred and eighty 3rd year medical students underwent pre-study multiple-choice question test (MCQ) to assess their confidence of cardiopulmonary examination and to detect cardiopulmonary murmurs. Three hundred and eleven students successfully passed (>51% test score). They were divided in two groups: G1 (n=155) firstly examine patients with cardiopulmonary disorders - pneumonia with crackles (CR), bronchial asthma with wheezes (WZ), typical mitral stenosis (MS) and aortic stenosis (AS) and then participate in the Harvey simulation (the same scenarios). G2 (n=156) firstly participate in the Harvey simulation and then examine real patients. At the end, all the students completed the post-study MCQ to assess their confidence in detecting murmurs. Statistical analysis was performed using Statistica 10.0. Data was presented as M±SD. For comparison of frequency we used χ^2 -criterion, Mann-Whitney and multiple logistic regression analysis were performed. $P < 0.05$ was considered statistically significant.

Results & Discussion

311 students completed all surveys. There was no difference in mean pre-study score between groups (58% vs 63%, $p > 0.05$). After completing the first activity there were no differences in detecting CR and WZ between groups (74% vs 72%, 80 vs 78%, $p > 0.05$ respectively), but there was significantly higher confidence in detecting MS and AS in G2 (90 vs 72%, $\chi^2 = 15.1$, $p < 0.001$ and 82% vs 94%, $\chi^2 = 11.2$, $p < 0.001$). After completing second activity, significant increase of confidence level in detection of MS, especially in G1 was observed (for detail information see Table 1). The mean score of post-study MCQ increase in both groups, but was higher in G2 (82 vs 90%, $\chi^2 = 3.9$, $p < 0.05$).

Conclusion

Both groups reported confidence in detecting abnormal heart and respiratory sounds after participation in Harvey simulations compared to baseline confidence level. Students who participated firstly in Harvey simulations demonstrated higher confidence level in detection of heart murmurs and higher post-study MCQ score. Our results confirmed that simulation-based training first and then implementation in real clinical practice is the most effective method under certain educational conditions.
